The range in the scale adopted here is only about  $m \cdot 3$ . The mean error of a single observation in the same scale is  $\pm m \cdot 075$ .

The estimates were arranged according to phase and divided into 9 groups of 10 plates each. The mean values thus obtained are given in Table 2 and graphically represented in the accompanying diagram. The provisional ephemeris of the minimum is

TABLE 2.

number of plates	phase	$\Delta m$
	P	m
10	'038	—'06
10	'182	'08
10	'284	'16
10	'398	'25
10	'484	'19

$$J. D. hel. M. T. Grw. 2423819 \cdot 259 + 152609 E \\ \pm 003 \pm 000020 (m. e.)$$

The magnitude of the variable is estimated to be in the neighbourhood of  $13^m$ . It is thus the faintest

variable star at present known to be similar to W Ursae majoris, SW Lacertae and the one announced in *A. J.* 821. There will, as anticipated in *B. A. N.* 16, p. 84; 1922, probably be many more of this type.

### Improved ephemeris of SS Carinae, by *Ejnar Hertzsprung*.

This eclipsing variable star was discovered at Harvard and in *H. C.* 115 the ephemeris of the minimum was given as J. D. 2410001<sup>d</sup>·53 + 3<sup>d</sup>·30070 *E*. On my plates of the  $\eta$  Carinae region the star was observed during increasing brightness corresponding to the

Harvard phase +<sup>d</sup>121 at J. D. hel. M. T. Grw. 2423818<sup>d</sup>·57 and 3828<sup>d</sup>·49. The ephemeris corrected by the aid of these new data is:

$$\text{Min. J. D. hel. M. T. Grw. } 2423828^{\text{d}} \cdot 36 + 3^{\text{d}} \cdot 300759 E.$$

### Provisional elements of 2 variable stars of the RR Lyrae type, by *Ejnar Hertzsprung*.

In an area of 100 square degrees round  $\eta$  Carinae there have as yet been found about 2 dozen variable stars of the  $\delta$  Cephei-type and a similar number of the eclipsing type, while I have only been able to classify 3 variable stars in this region as belonging

to the RR Lyrae type. This may be related to the fact that stars of the latter type do not show any sensible concentration towards the milky way. Provisional elements of one of these 3 stars, TX Carinae, have already been published in *B. A. N.* 52, p. 86.
