For Margot

Acknowledgments

I consider it a great privilege to have been able to use a little piece of the world's resources in pursuit of one of life's greatest pleasures: expanding one's understanding of the world. For that, I would like to thank my supervisors, Yiya Chen and Niels Schiller for inviting me to Leiden for this research. I feel extremely fortunate to have had the opportunity to follow my curiosity in carrying out this research over the last several years. It has been highly rewarding in many ways. I have learned a lot. Not only about language and cognition and science and statistics, but about life, as well.

Many people have contributed to this journey. Perhaps one of the biggest contributions has been in the form of the warm, supportive and fun environment created by my fellow PhDs and other colleagues at LUCL. Among them were my two wonderful paranymphs, Allison and Marijn, who also helped to ease the stress of these final preparations and even make them into something fun. I have fond memories of numerous outings, extended hacky sessions and the 1166 lunches. Some of the many others who made LUCL a special place to be were Linda Badan, Yifei Bi, Enrico Boone, Martine Bruil, Edoardo Cavirani, Camelia Constantinou, Elly Dutton, Margarita Gulian, Juliette Huber, Olga Kepinska, Martin Kohlberger, Orsat Ligorio, Sara Lusini, Marieke Meelen, Khalid Mourigh, Victoria Nyst, Ongaye Orkaydo, Stanly Oomen, Leticia Pablos, Piotrek Pisarek, Christian Rapold, Bobby Ruijgrok, Alexander Schwager, Mulugeta Tsegaye, Daan van de Velde, Rebecca Voll, Josh Wilbur, Man Wang and Junru Wu.

There are also a number of people who have made practical contributions to my research. Rinus Verdonschot was a big help when I first arrived in Leiden. You seemed to spout a continuous stream of useful tips on any number of things from statistics, programming software and experiment design to medical care, economic eating places, and the current best buy in mobile phones. Not to mention your help with running participants when you were in Beijing. Many thanks also to Kalinka Timmer for hours spent working with me on all aspects of running EEG experiments, from equipment set-up to running analyses in

SPSS. I learned a huge amount and had a lot of laughs along the way. I would like to thank Hamutal Kreiner for your expertise, enthusiasm and inspiration during my Masters dissertation. By teaching me to use LME and R, you set me up with the technical skills that got me started in my PhD. I don't know what I would have done without them. Thanks to Fermín Moscoso del Prado Martín and Holger Mitterer for helpful advice on the analysis of Chapter 2. Thank you, Antoine Tremblay, for generously answering all my emails relating to the EEG pre-processing with your R packages. Thanks to Fabian Tomaschek and Denis Arnold for improving my contour graphs and to Daan van der Velde for translating my Nederlandse Samenvatting.

Special thanks to Jacolien van Rij. I consider myself incredibly lucky that you decided to come and teach the LOT course in Groningen with Martijn Wieling and became interested in my data. I have learned so much over the last year working with you on the eye tracking data in Chapter 5. I am indebted to you for the time you invested working with me and teaching me how to use Generalised Additive Modelling. You are an excellent teacher and an excellent researcher. Thanks to Martijn Wieling, not only for the excellent LOT course, but also for your enthusiasm about my data and readiness to answer questions about GAMs. Special thanks also to Harald Baayen for generously hosting me in the Quantitative Linguistics Group lab in Tübingen while I was analysing the eyetracking data. Thanks for being excited about my data and for your insights about the analysis—your enthusiasm was a huge encouragement.

I would also like to thank the people at the Chinese Academy of Science Psychology Institute who provided me with expert help, as well as making me feel extremely welcome during my two research trips to Beijing.

To my dear whanau. Those of you who have been around me the last few years will know how proud and how lucky I feel to have such a wonderful family. Dad and Fran, Jake and Tom, with your love and support, your pride, warmth, fun and laughter, I keep you close to me, even from afar. Much love.

To Kamto. You enhanced the book greatly with your cover design. You also helped a lot with many practical and technical issues and averting near disasters along the way. But most of all thank you for sharing your time with me, your humour, creativity, your sense of beauty and your insights about the world.

To Mum, you are part of this book because you are a big part of who I am. You taught me how to be happy in the world and that is the one of the most precious things I have. This book is dedicated to you.

List of Figures

2.1	Pitch contours of the four tones of Beijing Mandarin	20
2.2	Pitch contours of Tone 2, Tone 3 sandhi and canonical low Tone 3	20
2.3	Mean reaction times Experiment 1	25
2.4	Mean reaction times Experiment 2	31
3.1	Trial procedure	46
3.2	Average ERP responses for voice-match, place-match and control conditions.	49
4.1	Pitch contours of the four tones of Beijing Mandarin	57
4.2	Pitch contours of Tone 2, Tone 3 sandhi and canonical low Tone 3	58
4.3	Average ERP signal for Contour and Mismatch primes at nine electrodes	62
4.4	Electrode map	63
4.5	Random wiggly curves over time for subjects and items . . .	64
4.6	Model plot of Prime frequency by Target frequency over Time per prime condition	67
5.1	Sample screen display during stimulus presentation	82
5.2	Random wiggly curves over time for subjects and items Ex- periment 1	84
5.3	Topographical maps of fixation proportions for VOT over time for the narrow and wide conditions Experiment 1	86
5.4	Topographical map of log frequency over time for Experiment 1	87
5.5	Plot of the interaction between manner and VOT	89
5.6	Random wiggly curves over time for participants and items Experiment 2	90
5.7	Topographical maps of fixation proportions for pitch over time in the narrow and wide conditions	91
5.8	Topographical map of log frequency over time Experiment 2 .	93
5.9	Plot of the interaction between manner and pitch	94
