Title: The human minor histocompatibility antigen HA-1 as target for stem cell based immunotherapy of cancer : pre-clinical and clinical studies

Issue Date: 2012-10-16

Acknowledgements

This thesis would have been impossible without the many supporters whom I would like to thank wholeheartedly. This comprises my academic teachers, my supporters on the working floor, my friends and my family. I am grateful to Prof. Els Goulmy for providing me this challenging topic, for the many scientific discussions and for her comments on this thesis. It was a great honor for me to execute this work in her world famous laboratory. Great thank goes to Prof. Theo van der Kwast who supported the difficult work on mHag specific immunotherapy of solid tumors. I am deeply indebted to Zohara Aghai not only for having worked almost daily and nightly with me on all aspects of this thesis but also for her fantastic humor, for the many discussions and for her unique cosmopolitan view. Similarly, I would like to thank Marcel Vermeij not only for having performed all histologies and immunohistochemistries in this thesis but also for the many fruitful scientific discussions and for teaching me the practical animal work. I am grateful to Bart Nijmeijer for the pleasant and fruitful collaboration regarding the leukemia experiments. I would like to thank Jos Pool for executing many molecular experiments, for providing his enormous expertise and also for the great time outside the lab. I am thankful for the close interactions with Andreas Buser and Attilio Bondanza which resulted in very pleasant ongoing collaborations also after my move to Hannover. I would like to thank Zuzana Stachová Rychnavská for her great support of all monitoring experiments and her collegiality. Finally, I am very grateful to all other members of the group of Els Goulmy, particularly to Els Blokland, Antoinette Joosten, Astrid van Halteren and Brigitte Wieles for their support and collegiality. I am grateful to Yvette van Hensbergen and Manon Slot for their great support, for the pleasant interactions and for sharing important knowledge on the stem cell experiments. I would like to thank all of my collaborators, particularly Prof. Dr. Arnold Ganser and Prof. Dr. Evi Weissinger from the Hannover Medical School and Prof. Dr. Nicolaus Kröger from the University Hospital Hamburg-Eppendorf. My special thanks go to Susanne Luther from the Hannover Medical School who collected most clinical material of this thesis. I am grateful to the excellent students with whom I worked together, i.e. Nadine Pouw, Damiet Smit, Cornelis van der Torren and Metha Maenhout. Moreover, I would like to thank all other colleagues especially of the Dept. of Immunohematology and Blood Transfusion and of the Dept. of Hematology for their support, friendship and positive interest. Particularly, I would like to mention Allan Thompson, Marieke Hoeve and the colleagues from the typing lab. My greatest thanks go to my parents for their endless support, love and encouragement throughout my life. Therefore, the success of this thesis is also and especially their success. Unfortunately, it is impossible to mention every supporter of this work. But, mentioning so many supporters already indicates that this project was not only a great scientific but also an enormous personal experience. For me, this work will be always associated with my supporters.
