Author: Kortlever, Ruud

Title: Selective and efficient electrochemical CO₂ reduction on nanostructured catalysts

Issue Date: 2015-12-22

List of publications

This thesis is based on the following publications

Chapter 2

R. Kortlever, J. Shen, K.J.P. Schouten, F. Calle-Vallejo and M.T.M. Koper
Catalysts and reaction pathways for the electrochemical reduction of carbon dioxide

Journal of Physical Chemistry Letters, **2015**, *6*, 4073-4083.

Chapter 3

R. Kortlever, K.H. Tan, Y. Kwon and M.T.M. Koper
Electrochemical carbon dioxide and bicarbonate reduction on copper in weakly alkaline media

Journal of Solid State Electrochemistry, **2013**, *17*, 1843-1849.

Chapter 4

R. Kortlever, C. Balemans, Y. Kwon and M.T.M. Koper
Electrochemical CO₂ reduction to formic acid on a Pd-based formic acid oxidation catalyst

Catalysis Today, **2015**, *244*, 58-62.

Chapter 5

R. Kortlever, I. Peters, S. Koper and M.T.M. Koper
Electrochemical CO₂ reduction to formic acid at low overpotential and with high faradaic efficiency on carbon-supported bimetallic Pd-Pt nanoparticles

ACS Catalysis, **2015**, *5*, 3916-3923.

Chapter 6

R. Kortlever, I. Peters, C. Balemans, R. Kas, Y. Kwon, G. Mul and M.T.M. Koper
A novel catalyst for the electrochemical reduction of CO₂ to C₁-C₅ hydrocarbons
Manuscript in preparation

Selective and efficient CO₂ electroreduction on nanostructured catalysts

Chapter 7

R. Kortlever, T.J.P. Hersbach, M. Koeman, M. Mulder, P. Bouwman and M.T.M. Koper

Electrochemical CO₂ reduction to formic acid on Pd₇₀Pt₃₀ nanoparticles on different supports and in gas diffusion electrodes

Manuscript in preparation

Other publications

R. Kas, R. Kortlever, A. Milbrat. M.T.M. Koper, G. Mul and J. Baltrusaitis

Electrochemical CO₂ reduction on Cu₂O-derived copper nanoparticles: controlling the catalytic selectivity of hydrocarbons

Physical Chemistry Chemical Physics, **2014**, *16*, 12194-12201.

R. Kas, R. Kortlever, H. Yilmaz, M.T.M. Koper and G. Mul

Manipulating the Hydrocarbon Selectivity of Copper Nanoparticles in CO₂ Electroreduction by Process Conditions

ChemElectroChem, **2015**, *2*, 354-358.

J. Shen, R. Kortlever, R. Kas, Y.Y. Birdja, O. Diaz-Morales, Y. Kwon, I. Ledezma-Yanez, K.J.P. Schouten, G. Mul and M.T.M. Koper

Electrocatalytic reduction of carbon dioxide to carbon monoxide and methane at an immobilized cobalt protoporphyrin

Nature Communications, **2015**, *6*, 8177.

J. Monzó, Y. Malewski, R. Kortlever, F. J. Vidal-Iglesias, J. Solla-Gullón, M. T. M. Koper and P. Rodriguez

Enhanced electrocatalytic activity of Au@Cu core@shell nanoparticles towards CO₂ reduction

Journal of Materials Chemistry A, **2015**, DOI: 10.1039/C5TA06804E

R. Kas, K. Khazzal Hummadi, R. Kortlever, P. de Wit, A. Milbrat, M.W.J. Luiten-Olieman, N.E. Benes, M.T.M. Koper and G. Mul

CO₂ reduction with copper hollow fiber electrodes

Submitted for publication

O. Diaz-Morales, S. Raaijman, R. Kortlever, P.J. Kooyman, T. Wezendonk, J. Gascon, W.T. Fu and M.T. M. Koper

Iridium-based double perovskites for efficient water oxidation in acid media

Submitted for publication

B. Limburg, J. Wermink, S.S. van Nielen, R. Kortlever, M.T.M. Koper, E. Bouwman and S. Bonnet

Stabilization of a ruthenium photosensitizer for photocatalytic water oxidation by binding to a liposome bilayer

Manuscript in preparation

Selective and efficient CO₂ electroreduction on nanostructured catalysts

Curriculum vitae

Ruud Kortlever was born in Alblasserdam, The Netherlands on June 29th, 1987. After finishing his Gymnasium (high school) education at the Willem de Zwijger College in Papendrecht in 2005, he started his bachelor studies in Chemistry at Leiden University. During his bachelor he worked with dr. T.J. Mooibroek, prof. dr. E. Bouwman and prof. dr. E. Drent on transesterification reactions in an alternative route towards 4,4'-methylenediphenyldiisocyanate (MDI). He continued his education with a master study in Chemistry at Leiden University in the 'Research in Chemistry' track, with a specialization in 'Design and Synthesis'. During his master studies he worked as a summer research intern at Grinnell College in the summer of 2010, where he synthesized new ligands and new molybdenum di-imido, di-oxido and alkylidene complexes. In 2011 he completed his master studies with a thesis entitled 'Catalytic synthesis of primary amines via N-alkyl-formamide' under the supervision of dr. S. Raoufmoghaddam, prof. dr. E. Bouwman and prof. dr. E. Drent.

In November 2011 Ruud started his PhD project in the group of prof. dr. M.T.M. Koper, of which the results are presented in this thesis. During his PhD he collaborated with the groups of prof. dr. G. Mul at the University of Twente and dr. P. Rodriguez at the University of Birmingham. He presented his work during multiple national and international conferences and symposia for which he was awarded a presentation award and two poster awards.

Appendix I

Supporting information to Chapter 4

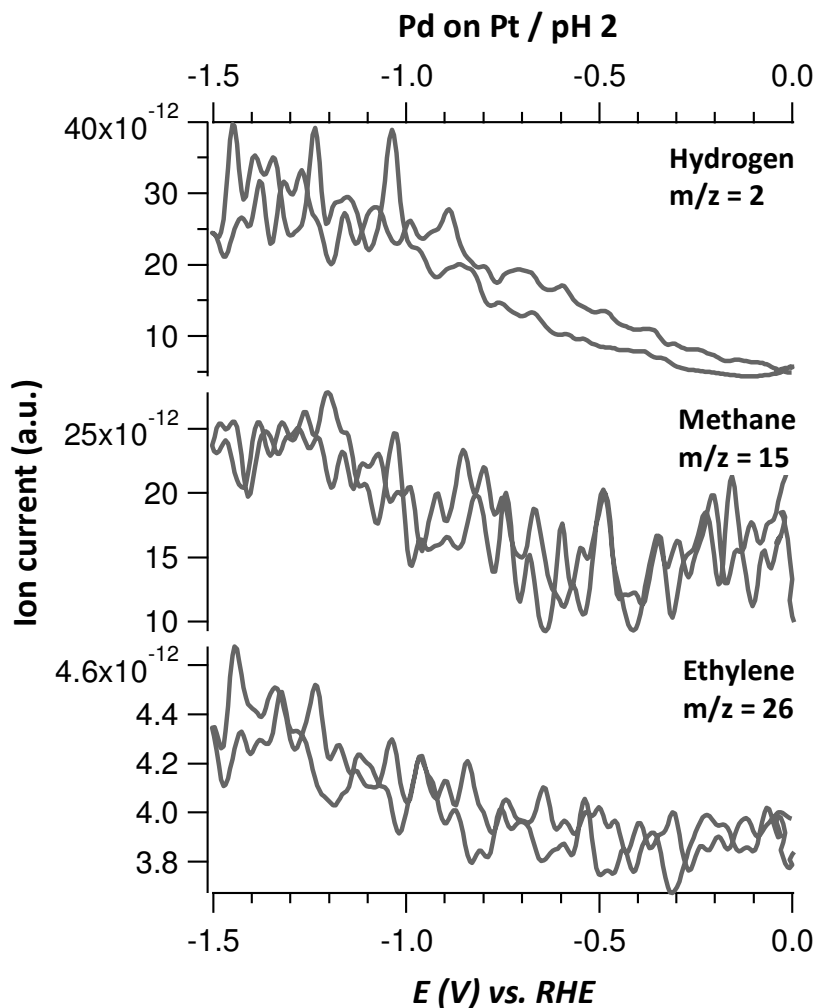

Appendix I.1 OLEMS measurements CO₂ reduction on Pd-Pt

Figure AI.1 Formation of hydrogen ($m/z = 2$), methane ($m/z = 15$) and ethylene ($m/z = 26$) during CO₂ reduction on Pd-Pt followed with OLEMS in a pH 2 phosphate buffer electrolyte (0.1 M H₃PO₄/ 0.1 M KH₂PO₄).

Figure A1.2 Formation of hydrogen ($m/z = 2$), methane ($m/z = 15$) and ethylene ($m/z = 26$) during CO_2 reduction on Pd-Pt followed with OLEMS in a pH 6.7 phosphate buffer electrolyte (0.1 M K_2HPO_4 /0.1 M KH_2PO_4).

Appendix I.2 Poisoning of the Pd-Pt electrode

Figure AI.3 Cyclic voltammogram of a Pd-Pt electrode in a phosphate buffer at pH 6.7 (0.1 M KH_2PO_4 / 0.1 M K_2HPO_4) in the presence of CO_2 at a scan rate of 50 mV/s.

Appendix II

Supporting information to Chapter 5

Appendix II.1 Nanoparticle synthesis

Table AII.1 Volumes of K_2PdCl_4 , K_2PtCl_4 and EDTA stock solutions used to synthesize a series of $Pd_xPt_{(100-x)}/C$ nanoparticles.

Composition	K_2PdCl_4 (0.05 M) / μl	K_2PtCl_4 (0.05 M) / μl	EDTA (0.1 M) / μl
Pd_5Pt_{95}/C	76	1430	753
$Pd_{10}Pt_{90}/C$	152	1354	753
$Pd_{20}Pt_{80}/C$	301	1205	753
$Pd_{30}Pt_{70}/C$	456	1050	753
$Pd_{40}Pt_{60}/C$	603	903	753
$Pd_{50}Pt_{50}/C$	753	753	753
$Pd_{60}Pt_{40}/C$	903	603	753
$Pd_{70}Pt_{30}/C$	1050	456	753
$Pd_{80}Pt_{20}/C$	1205	301	753
$Pd_{90}Pt_{10}/C$	1354	152	753
$Pd_{95}Pt_5/C$	1430	76	753
Pd/C	1506	0	753

Appendix II.2 IR compensation

Electrochemical impedance measurements were carried out prior to the long term electrolysis experiments to determine the resistance of the H-cell (see section S3). The impedance measurements were carried out using an Ivium A06075 potentiostat, at frequencies ranging from 10 kHz to 0.1 to measure the solution resistance. Since the resistance of the cell can vary for each experiment, it is important to correct for the resistance of the cell so that the applied potential during the electrolysis experiment corresponds to the intended electrode potential. A Nyquist plot was plotted as shown in Figure 1 and in the high-frequency part a linear fit was performed and the axis intersection was calculated. The value of this intersection represents the ohmic resistance of the cell. An average of 3 measurements was taken to calculate the value of R . Typically, very small resistances were measured, ranging from 3 to 10 Ω . This measured resistance was compensated for during the electrolysis experiments.

Figure AII.1 Typical Nyquist plot used to calculate the resistance of the cell prior to electrolysis experiments.

Appendix II.3 Faradaic efficiency

Faradaic efficiency measurements were performed in a custom-made H-cell over the course of 2 hours. Every 10 minutes a sample of 100 μl was taken from the cathodic compartment. These samples were analyzed with HPLC to determine the concentration of formic acid. During the 10 minutes of electrolysis current-time plots were made, that were used afterwards to calculate the total charge (C) that was consumed. Since every molecule of formic acid is produced from CO_2 plus $2e^-$, the partial charge of formic acid could be calculated from the amount of formic acid that was produced multiplied with 2 times the elementary charge of an electron (e). The faradaic efficiency was then determined by dividing the partial charge for formic acid by the total amount of charge that was consumed, as shown in Equation 1. The FE was calculated for the different nanoparticle compositions.

$$\text{FE} = \frac{[\text{Formic Acid}] \cdot 2e}{\Sigma\text{Charge}} \cdot 100\% \quad (1)$$

Figure AII.2 Faradaic efficiencies for formic acid production from CO_2 on $\text{Pd}_x\text{Pt}_{(100-x)}/\text{C}$ nanoparticles in a 0.1 M K_2HPO_4 / 0.1 KH_2PO_4 electrolyte (pH 6.7) that was saturated with CO_2 at potentials ranging from 0 V vs. RHE to -0.5 V vs. RHE (the applied potential was corrected for the cell resistance). The experiments were conducted for 2 hours, while samples of the electrolyte were taken every 10 minutes.

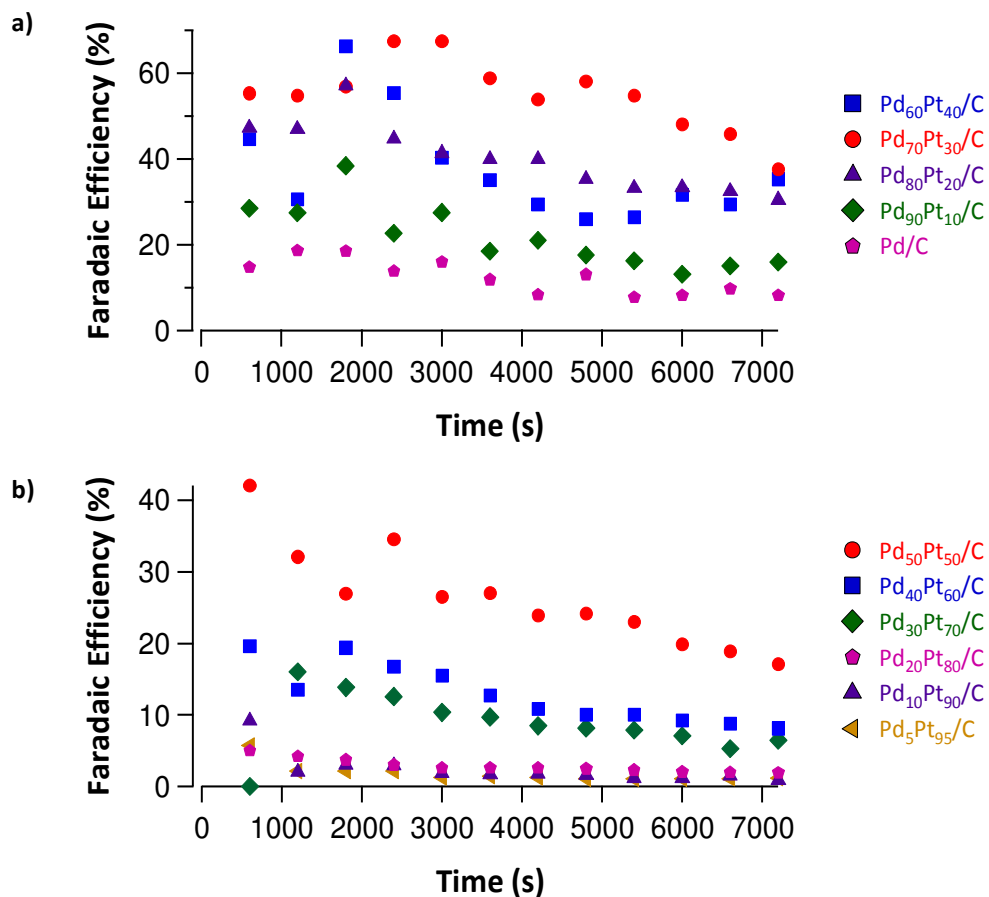

Figure AII.3 Faradaic efficiencies for formic acid production from CO₂ on Pd_xPt_(100-x)/C nanoparticles in a 0.1 M K₂HPO₄ / 0.1 KH₂PO₄ electrolyte (pH 6.7) that was saturated with CO₂. The electrolysis experiments were conducted at -0.5 V vs. RHE (the applied potential was corrected for the cell resistance) in. The experiments were conducted for 2 hours, while samples of the electrolyte were taken every 10 minutes.

Table AII.2 Tabulated faradaic efficiency values for CO₂ reduction to formic acid on Pd₅Pt₉₅/C to Pd₅₀Pt₅₀/C nanoparticles over the course of 2 hours.

Time (s)	Pd ₅ Pt ₉₅ /C FE (%)	Pd ₁₀ Pt ₉₀ /C FE (%)	Pd ₂₀ Pt ₈₀ /C FE (%)	Pd ₃₀ Pt ₇₀ /C FE (%)	Pd ₄₀ Pt ₆₀ /C FE (%)	Pd ₅₀ Pt ₅₀ /C FE (%)

Appendix IV

Supporting information to Chapter 7

Appendix IV.1 X-ray diffraction

Figure AIV.1 X-ray diffraction spectra of Pd₇₀Pt₃₀ nanoparticles on different support materials; multi-walled carbon nanotubes (MWCNT), Vulcan XC-72 (C) and reduced graphene oxide (rGO).

Appendix IV.2 IR compensation

Electrochemical impedance measurements were carried out prior to the long term electrolysis experiments to determine the resistance of the H-cell (see section S3). The impedance measurements were carried out using an Ivium A06075 potentiostat, at frequencies ranging from 10 kHz to 0.1 to measure the solution resistance. Since the resistance of the cell can vary for each experiment, it is important to correct for the resistance of the cell so that the applied potential during the electrolysis experiment corresponds to the intended electrode potential. A Nyquist plot was plotted as shown in Figure S3 and in the high-frequency part a linear fit was performed and the axis intersection was calculated. The value of this intersection represents the ohmic resistance of the cell. An average of 3 measurements was taken to calculate the value of R . Typically, very small resistances were measured, ranging from 3 to 10 Ω . This resistance was compensated for during the electrolysis experiments.

Figure AIV.2 Typical Nyquist plot used to calculate the resistance of the cell prior to electrolysis experiments.

Appendix IV.3 Faradaic efficiency

Faradaic efficiency measurements were performed in a custom-made H-cell over the course of 2 hours. Every 10 minutes a sample of 100 μl was taken from the cathodic compartment. These samples were analyzed with HPLC to determine the concentration of formic acid. During the 10 minutes of electrolysis current-time plots were made, that were used afterwards to calculate the total charge (C) that was consumed. Since every molecule of formic acid is produced from CO_2 requires $2 e^-$, the charge corresponding to formic acid production can be calculated from the amount of formic acid that was produced in the entire volume of the cell multiplied by 2 times the elementary charge (e). The faradaic efficiency was then determined by dividing this charge for formic acid formation by the total amount of charge that was consumed, as shown in Equation 1. The FE was calculated for the different nanoparticle compositions.

$$\text{FE} = \frac{[\text{Formic Acid}] \cdot 2e}{\Sigma\text{Charge}} \cdot 100\% \quad (1)$$

Figure AIV.3 Faradaic efficiencies for formic acid production from CO_2 on $\text{Pd}_{70}\text{Pt}_{30}$ nanoparticles on a reduced graphene oxide (rGO) support in a 0.1 M K_2HPO_4 / 0.1 KH_2PO_4 electrolyte (pH 6.7) that was saturated with CO_2 at potentials ranging from 0 V vs. RHE to -0.5 V vs. RHE (the applied potential was corrected for the cell resistance). The experiments were conducted for 2 hours, while samples of the electrolyte were taken every 10 minutes.

Figure AIV.4 Faradaic efficiencies for formic acid production from CO_2 on $\text{Pd}_{70}\text{Pt}_{30}$ nanoparticles on a multi-walled carbon nanotube (MWCNT) support in a $0.1 \text{ M K}_2\text{HPO}_4 / 0.1 \text{ M KH}_2\text{PO}_4$ electrolyte (pH 6.7) that was saturated with CO_2 at potentials ranging from 0 V vs. RHE to -0.5 V vs. RHE (the applied potential was corrected for the cell resistance). The experiments were conducted for 2 hours, while samples of the electrolyte were taken every 10 minutes.

Table AIV.1 Tabulated faradaic efficiency values for CO_2 reduction to formic acid on $\text{Pd}_{70}\text{Pt}_{30}$ nanoparticles on reduced graphene oxide (rGO) as support at different potentials over the course of 2 hours.
