# Özet

Üçüncü nesil uzaktan eğitim kapsamında kitlesel açık erişim çevrimiçi dersler (massive open online courses, MOOC'lar) sayesinde yüksek öğrenimde herkes istediği yerden ücretsiz eğitim alabilmektedir. Son yıllarda, eğitimde MO-OC'ların yeri üzerine birçok çalışma yapılmıştır, ancak öğrencilerin kazanımları üzerine olan çalışmalar sınırlıdır. Bu çalışmada, açık erişim çevrimiçi derslerin tasarlanmasına yönelik birtakım önerileri belirlemek amacıyla, öğrencilerin MOOC'lardaki kazanımlarına ilişkin literatürü gözden geçirildi. İnceleme, bilimsel literatür veritabanlarının sistematik olarak araştırılmasının ardından, 3P (presage [öngörü], process [süreç] ve product [üriin]) öğretim ve öğrenim modelinin temel bileşenlerine yönelik eleştirel bir analizle gerçekleştirildi (Biggs, 2003). 56 yayının bulguları sentezlenerek, öğrencilerin katılımını ve akademik başarıyı geliştirmek ve terk etme oranlarını düşürmek amacıyla 13 ders tasarımı önerisi geliştirildi. Gerek ileriki araştırmalarda incelenmek üzere gerek ise de MOOC'ların mevcut içeriğini geliştirerek ve zenginleştirerek öğrenim kazanımlarını en iyi hale getirmek için bazı uygulama önerileri sunuldu.

Anahtar sözcükler: 3P modeli, başarı, değerlendirme, katılım, öğrenim kazanımları.

assive Open Online Courses (MOOC) are built on the impression that "information is everywhere" by extending access to education. A MOOC is a course, but it is open, distributed, participatory, and part of lifelong network learning. The underlying idea of a MOOC is accessibility, since anyone can participate by working collaboratively either to acquire new knowledge or to expand existing knowledge. This implies that MOOCs create a pathway for lifelong learning processes. MOOCs are online classes in

### Abstract

Massive open online courses (MOOCs) as a third generation distance education enable anyone anywhere to study for free in higher education. In recent years, various studies have been conducted on the position of MOOCs in education, but studies on students' learning outcomes are limited. In this study, literature concerning students' learning outcomes in MOOCs was explored with the aim of identifying a set of suggestions to design open online courses. The review was accomplished through a systematic search within scientific literature databases followed by a critical analysis with the main components of 3P (*presage-process-product*) model of teaching and learning (Biggs, 2003). Findings of the 56 publications were synthesized which resulted in the formulation of 13 course design suggestions in order to enhance students' engagement, academic achievement and lower attrition rate attrition. Some implications are proposed for further research and for providers to improve and enrich the current context of MOOCs to optimize students' learning outcomes.

Keywords: 3P model, achievement, assessment, engagement, learning outcomes.

which anyone can participate, regardless of location, in most cases for free. They are comprised of short video lectures, simulations, and online labs combined with computer-graded tests and online forums where participants can discuss the course content or get help (Hoy, 2014). Basically, MOOCs are a form of online learning that share some common features: open access using the Internet, free of charge, asynchronous, interactive user forums, and the opportunity to receive a certificate upon successful completion (EDUCAUSE, 2011). Student

learning outcomes in a MOOC platform may not be the same as those in regular online or on-campus education, which makes a significant contribution to ensuring the quality of MOOCs. Understanding which factors account for students' learning outcomes in open online courses, including student characteristics, teaching context and learning activities, is an important step toward designing efficacious courses and improving open online learning. Recent attempts to use learning analytics and data mining to understand learners' behaviour provide ambiguous findings on learning outcomes in MOOCs. The similarity of behavioural patterns among students who fail and pass in the course context compels researchers to ask further questions and to conduct deeper analyses of students' learning behaviours and experiences (Wen and Rose, 2014). On the other hand, other research findings that evaluate the value of the MOOC phenomena indicate that students' learning experiences and study behaviours in MOOCs fluctuate (Yuan, Powell, & Olivier, 2014). Furthermore, although the low retention rate in MOOCs has been extensively debated and pointed out as a failure, research on the pedagogical aspects of MOOCs provides more insights about the deficiencies of the instructional model used in open learning environments (Fasihuddin, Skinner, & Athauda, 2013). That is to say, efforts to increase completion rates should be designed and implemented in light of learning and teaching theories, as well as learners' preferences and needs.

Despite the enthusiasm for and expectations of MOOCs as new learning platforms, many studies are based on personal observations and/or experiences of researchers either as instructors or participants in MOOCs (Fisher, 2014; Kop, 2011; Stefanic, 2014; Zutshi, O'Hare, & Rodafinos, 2013). There are also auto ethnographic studies in which the researcher acts as a participant observer (Wasson, 2013). Since 2013 several empirical studies have been published in peerreviewed journals, which mainly focused on effectiveness, participation, reasons for low completion rates or high drop-out rates, and assessment. The small number of empirical studies is likely related to the difficulty of examining the huge amount of complex data generated by MOOCs (Fischer, 2014; Fournier, Kop, & Durand, 2014). At the same time, researchers have also began to point out the advantages of analysing huge digital data in the context of assessment, process of learning, and social interaction (Thille et al., 2014). In addition, although most research on MOOCs is quite recent, some review studies have already been published. The reviews are mainly oriented towards providing a general idea of the state-of-the-art in MOOC phenomenon from various perspectives (Ebben & Murphy, 2014; Gasevic, Kovanovic, Joksimovic, & Siemens, 2014; Hew & Cheung, 2014; Koutropoulos & Zaharias, 2015;

Liyanagunawardena, Adams, & Williams, 2014). Nevertheless, these reviews provide limited practical implications for students' learning outcomes. Therefore, as Reich (2015) emphasized, additional research must be conducted to explore factors that promote students' learning. In addition to other research reviews, the current study adds a new perspective to the MOOC literature by drawing on findings of published MOOC studies to identify the course design principles that impact students' learning outcomes.

# Purpose of the Study

Even though MOOCs are rooted in online learning, scholars suggest that pedagogical aspects of these massive courses may have a distinguishable nature in *laissez-faire* environments with rich data (Bayne & Ross, 2014; Redfield, 2015). Grounded on a diversity of students' backgrounds and intentions, outcomes of teaching and learning processes in MOOCs can be misleading if metrics from conventional inclass or online education are applied. As the traditional variables in higher education might play out quite differently in MOOCs, a systematic review of the MOOC literature could provide essential insights to understand new, diverse concepts including achievement, assessment, retention, and participation as crucial ingredients for students' learning outcomes (DeBoer, Ho, Stump, & Breslow, 2014). Understanding how these concepts are related to students' learning outcomes is important since these are crucial elements for MOOC course design, which helps enhance the pedagogical aspects of MOOCs as well as provide concrete perspective for MOOCs (Glance, Forsey, & Riley, 2013; Perna et al., 2014). For this purpose, the 3P Model (Fig. 1) of teaching and learning in universities by Biggs (2003) was used as a framework to provide an organized way of structuring findings identified in the literature that appear to explain students' learning outcomes.

According to Biggs (2003), teaching and learning in universities are considered an interacting system of four components: students, learning environment, learning processes, and learning outcomes. Previous studies effectively used this model as a framework to review the literature (Han, 2014; Noroozi, Weinberger, Biemans, Mulder, & Chizari, 2012; Spelt, Biemans, Tobi, Luning, & Mulder, 2009). In the current review, Biggs's 3P Model is used to structure the findings into each component, thereby presenting a comprehensive model for successful learning outcomes in MOOCs. This model might enable curriculum and course developers in open online learning platforms to gain a holistic understanding of factors influencing students' learning outcomes. Explicitly, this study aims to review existing MOOC research in order to answer the following research questions:

- "Which student characteristics are related to students' learning outcomes in MOOCs?"
- "Which teaching context is related to students' learning outcomes in MOOCs?"
- "Which learning activities are related to students' learning outcomes in MOOCs?"

# **Methods**

This review covers literature published in or before the year this study started (2015). The digital catalogue search of Leiden University was used to conduct a research that spanned multiple databases related to educational and social sciences: Academic Search Premier (EBSCO), ProQuest, Annual Reviews, ScienceDirect, Cambridge Journals, DOAJ, SAGE, Web of Science, SSRN (Social Science Research Network), and Wiley Online Library.

# Inclusion and Exclusion Criteria

The following criteria were formulated to determine if previous studies should be included in the literature review: (a) published in peer-reviewed journals, (b) reported empirical findings, (c) reported in English, and (d) related with learning outcomes in MOOCs. Online databases were searched using Boolean logic with the keywords; MOOC, MOOCs, massive open online course, and learning outcomes. This search generated 203 hits. The first author subsequently read all studies and identified whether each article matched the criteria mentioned above. After the first scan for appropriateness, 46 were not published in peer-reviewed journals, leaving 157 studies. Among them, 84 did not provide empirical findings, leaving 73 articles. Only 56 of these research studies were selected for this review since the others were not related to student learning outcomes (Liyanagunawardena et al., 2014, Noroozi et al., 2012). The ■ Appendix I summarizes the 56 studies, showing the authors, publication date, purpose, research question(s), method, sample, results, and implications for research and practice.

# Data Analysis

Initially the first author read all text segments of the Results and Discussion sections of the selected articles that related to students' learning outcomes to identify the factors influencing students' learning outcomes. Following careful reading of the Results and Discussion sections of each reviewed study, the critical analysis was executed guided by research questions based on Biggs' (2003) 3P Model. The factors identified as contributing to students' learning outcomes were refined in an iterative manner during which alternative classifications were considered. An outside researcher conducted the same analysis procedure in order to ensure the internal consistency of the research. This selection was then categorized into four interrelated components (i.e., student characteristics, learning environment, learning process, and learning outcomes) based on Biggs model (**1** Fig. 2).

Fig. 1. The 3P model of teaching and learning (Biggs, 2003).

In the present study, the first factor that presaged learning outcomes was student characteristics, which includes academic (i.e., prior-knowledge, prior-experience, and expertise) and personal (i.e., self-motivation, self-confidence, and participation) student characteristics. The other factor that presaged learning outcomes was course features. These features are part of the learning environment in which MOOCs are set, which is established by instructors or providers in terms of pedagogy, tools, and assessment. In terms of factors that portend learning outcomes, some of the student characteristics and course features were related to each other. For example, course assessments were related to student characteristics and some student characteristics may have affected the efficiency of tools used in MOOCs. The learning process component consists of findings related to learning activities while. The final component (i.e., learning outcomes) includes students' engagement, achievement, and attrition. As Fig. 2 suggests, the adopted 3P model from Biggs (2003) identifies the relationship among and/or between these four components and provides a comprehensive framework of how factors that emerged from published studies interacted and related to students' learning outcomes.

## **Results**

The factors related to learning outcomes extracted from the reviewed publications were clustered into four inter-related components from Biggs model (2003; Fig. 2):

- Students' characteristics
- Learning environment
- Learning process
- Learning outcomes

Fig. 2. Framework of the factors account for learning outcomes in MOOCs (adapted from the original 3P model of Biggs, 2003).

The component of students' characteristics was divided into academic (i.e., prior-knowledge, prior-experience, expertise, academic achievement, and matriculation) and personal (i.e., self-motivation, self-confidence, intrinsic motivation, participation, social economic statute, and task-oriented) student characteristics. The course features component addressed course design elements of MOOCs that characterize the learning environment including pedagogy, tools, tasks, duration, feedback, and assessment. The component process factors refered to students' learning activities in MOOCs and the component product factors included students' engagement, achievement, and attrition.

# **Presage Factors**

## Students' Academic Characteristics

Student' academic characteristics referred to learning goals (of an individual or a group of individuals), prior-experience, priorknowledge, expertise, academic achievement, procrastination, matriculation, and task-orientation. Many of the reviewed studies highlighted that the students who participated in forums, discussion groups, and blogs were well-educated and taking the courses to gain professional skills (Gillani & Eynon, 2014). Moreover, students with task-oriented skills tended to be successful in MOOCs (Liu et al., 2014).

Students' prior experiences with e-learning were found to be positively related to their participation level. Experienced students in networked learning participated at a higher level in MOOCs (Greene, Oswald, & Pomerantz, 2015; Kop, Fournier, & Mak, 2011). The experienced students tended to participate and to contribute more than novice learners in discussion forums, blogs, and learning networks; new students tended to use the ready-made materials in MOOCs (Fournier et al., 2014; Milligan, Littlejohn, & Margaryan, 2013). Moreover, one recent study indicated the gap between novice and experienced MOOCcers as a possible 'dark side' of MOOCs since the novice MOOC participants of Rhizo 14 cMOOC felt isolated, which limited their engagement (Mackness & Bell, 2015).

Although findings of the reviewed studies (Breslow et al., 2013; Greene et al., 2015; Konstan, Walker, Brooks, Brown, & Ekstrand, 2015) did not indicate any significant correlation between either age or gender with student learning outcomes, the authors found a relationship between student level of schooling and outcomes, as higher level of schooling is associated with higher participation and lower attrition.

For student retention in MOOCs students' prior achievement also seemed to be an influential factor (de Freitas, Morgan, & Gibson, 2015), although findings about this relationship were ambiguous. For example, Jiang, Williams, Warschauer, He, & O'Dowd (2014) found that students with a poor academic background were the ones who completed and received the certificate. On the other hand, other research indicated that matriculated students were more likely to complete a MOOC (Chen & Chen, 2015; Firmin et al., 2014) since they are more task-oriented (Jiang et al., 2014). Although students enrol in MOOCs for degree purposes (Chen & Chen, 2015), those who score high on procrastination on academic tasks (Diver & Martinez, 2015) tended to dropout of the course.

## **Student Personal Characteristics**

The second category of student characteristics, personal characteristics, refer to non-academic characteristics including selfmotivation, self-confidence, intrinsic motivation, intentions, self-commitment, and socioeconomic status. In general, these individual student characteristics were related to how students engaged with MOOC activities and their completion of the course. For example, Kizilcec & Schneider (2015) found that students' intentions and their level of intrinsic motivation were positively related to the extent to which students watched videos and their assessment completion in MOOCs. Similarly, students with high self-motivation were more engaged in cMOOCs (Castaño-Garrido, Maiz-Olazabalaga, & Garay-Ruiz, 2015; Dillahunt, Wang, & Teasley, 2014). This also was the case with students who reported a relatively high self-confidence (Milligan et al., 2013). Finally, students with a low socioeconomic status who self-identified as being unable to afford a formal education seemed to put more effort into being successful in the course compared to other students (Dillahunt et al., 2014).

## **Course features: Pedagogy**

Many of the reviewed studies explicitly explained the design and implementation process of the MOOCs, but only a limited number of studies examined how the design of MOOCs was related to students' learning activities or outcomes. The pioneering empirical studies concentrated on only two philosophical MOOC designs: cMOOCs and xMOOCs (Rodriguez, 2012). After several years, however, the research shows that more varieties of xMOOC and cMOOC had emerged (Clark, 2013). It is what actually happens in these courses, however, rather than the specific pedagogical beliefs, that are essential for students' learning outcomes.

Students' learning mostly results from an interface between the provided content and pedagogical strategies when these engage the learner's interest (Khine &

Lourdusamy, 2003). Learners seem to feel more interactive, open, connected, and autonomous in small cMOOC [e.g., SPOCs (Small Private Open Courses) or SCOOCs (Small Connectivist Open Online Courses)] platforms (Mackness, Waite, Roberts, & Lovegrove, 2013). Some other factors, including 'flexibility to do and read,' 'course design,' and 'receiving feedback from a knowledgeable person,' are also identified as influential factors on students' learning in cMOOCs (Fournier et al., 2014). However, many MOOC students (i.e., achievers, non-achievers, live, and archive) follow the course content and watch videos in the sequential order specified by the instructor (Campbell, Gibbs, Najafi, & Severinski, 2014; Perna et al., 2014). Furthermore, most of the MOOCs follow the objectivist-individual teaching method, which actually contradicts basic features of MOOCs such as active learning and connectivisim (Toven-Lindsey, Rhoads, & Lozano, 2015). MOOC platforms can facilitate both online and offline communication, which is suitable for designing social learning experiences and many studies connect the pedagogy of a MOOC and the interaction and communication of students. The lack of student-student and student-instructor interaction in many MOOCs generally cannot provide engaged learning experiences (Hew & Cheung, 2014), whereas MOOCs that facilitate student-student interaction by asking students to collaborate with their peers positively influenced students' engagement (Trumbore, 2014) and their satisfaction with the course (Al-Atabi & DeBoer, 2014). These findings are confirmed by Kizilcec & Schneider (2015) who found that students show relatively more engagement when they are enrolled in MOOCs with their colleagues and/or friends.

Some authors claim that MOOCs lack a coherent instructional design process including learning objectives, instructional activities, and assessment (Margaryan, Bianco, & Littlejohn, 2015; Spector, 2014). In fact, there is a strong positive relationship between developing a curriculum that is consistent with learning objectives and assessments (Falchikov & Goldfinch, 2000). This means that in many cases, a lack of instructional objectives in MOOCs makes them insufficient to achieve the expected learning outcomes. If we compare xMOOCs and cMOOCs, connectivist oriented MOOCs seem to provide more quality in terms of instructional principles, such as students' activation, authentic resources, application and integration of learning activities, collaboration between peers, development of collective knowledge, and differentiation between various student groups (Margaryan et al., 2015). But this doesn't prove that xMOOCs are inappropriate for student learning. In MOOC environments, the flexibility of students to follow individualized learning pathways is sometimes incompatible with the course providers' or instructors' pre-determined course design structure. Therefore, researchers should think of new metric system to evaluate the design quality of MOOCs.

# **Course Features: Tools**

Materials are the backbone of teaching-learning activities by supporting students with different learning styles in meaningful learning (Klimova & Poulova, 2013). MOOCs utilize commonly used teaching materials such as instruction videos, e-resources, e-books, and exercise sets. In addition, mostly in cMOOCs, social media tools such as discussion groups, blogs, web forums, social network sites (SNSs), Wikis, and podcasts encourage students to participate, contribute, and collaboratively construct knowledge (Veletsianos, Collier, & Schneider, 2015). Some authors found positive relationships between the use of social media tools in MOOCs and learning outcomes (e.g., the use of Google+) (Vivian, Falkner, & Falkner, 2014). In addition, some exclusive learning activities such as *challenge-lesson-resolution*, the daily, and brain rewiring facilitated students' participation and discussion, which resulted in students being more satisfied with the course (Al-Atabi & DeBoer, 2014; Kop et al., 2011). In addition to the potential beneficial results associated with integrating social media tools into the learning process, learners can empower themselves and contribute more autonomously to their own learning. Similar to open educational resources (OER) in education, availability and accessibility of learning tools and materials put MOOCs in an advantageous position, which means that the openness and flexibility of MOOCs are two major incentives for participation (Yousef, Chatti, Wosnitza, & Schroeder, 2015).

Whereas the pedagogical quality of instructional materials in online learning has been investigated by many researchers (Klimova & Poulova, 2013), only a few researchers have done so in MOOCs. Research on instructional materials in MOOCs indicates that readings (50%) and videos (40%) are the most used supportive materials; among other materials the discussion forums are cited by only 6% of the students as a useful learning resource (Giannakos, Jaccheri, & Krogstie, 2014; Liu et al., 2014). Pre-recorded videos are quite popular in open education platforms, and some authors show positive evaluations of pre-recorded video based on xMOOCs (Adams, Yin, Madriz, & Mullen, 2014; Firmin et al., 2014). However, students generally prefer to watch MOOC videos in a group and with individual control

over videos (Gasevic et al., 2014). This mode of watching videos increases student concentration and engagement, and balances synchronicity, video interactivity, and group discussion. Yet, simply incorporating interactive videos into an online learning environment may not always result in enhanced learning. Research shows that embedding topic related questions in a video-based online learning environment promotes meaningful student learning, improves the amount of student interaction, and increases the time students spend on the learning materials (Adams et al., 2014). Thus, MOOC platforms using question-embedded videos may help students be more active and consequently promote meaningful learning. Finally, including the instructor's face in the videos has no significant effect on students' recall and transfer learning, which would help students connect previous experiences to new learning contexts (Kizilcec et al., 2015).

## **Course Features: Duration**

Generally, the popular standard for MOOC length changes between 6-8 week classes. Longer MOOCs can make both developers and students feel overwhelmed. This may be why the duration of the MOOC is negatively associated with the completion rate. As Jordan (2014, 2015) indicated, students tend to dropout of the course when the duration is extended.

## **Course Features: Assessment and Feedback**

Assessment is one of the most criticized issues in MOOCs (Clarà & Barberà, 2014), with studies mainly focused on the credibility of e-assessment as well as self and peer-assessment. Self and peer-assessment are distinguishing features of MOOCs since they relieve instructors from grading huge number of assignments and quizzes, and support learners in enhancing their learning and understanding.

Use of self and peer-assessment as formative evaluation helps students see their progress throughout the course. Using self and peer-assessment as an assessment *for* learning can be useful if proper feedback or assessments with rubrics are provided to students during the formative assessment processes; otherwise students cannot become aware of their biases and/or misunderstanding (Admiraal, Huisman, & Pilli, 2015; Admiraal, Huisman, & Van de Ven, 2014). Peer and self-assessment is eventually needed and will be an enduring quality of MOOCs since it is one of the most beneficial ways to cope with disadvantages of having so many students enrolled in the same course simultaneously. Thus, it would be useful to increase the effectiveness, credibility, and usability of self and peer-assessment (Vista, Care, & Griffin, 2015). Moreover, providing feedback and guidance (i.e., a rubric) on peer and self-assessment rating biases can help enhance students' learning. Using predetermined rubrics enable students to recognize their mistakes and misunderstandings, which provides a more accurate learning experience and better serves the purpose of assessment (Balfour, 2013; Kulkarni et al., 2013). Students learn in meaningful ways when they receive feedback from peers in discussion forums since they feel more comfortable and open when interacting with each other (Comer, Clark, & Canelas, 2014; Liu et al., 2014).

To improve assessment accuracy in MOOCs, machinebased assessment would be an alternative method to peer and self-assessment. Thus, some research studies have investigated the usability of machine assessment to evaluate students' learning outcomes. However, MOOC instructors have criticized Automated Essay Scoring (AES) tools because the way in which they score writing assignments in MOOCs is unsatisfactory. The reason is that AESs can be less accurate and reliable for evaluating students' writing assignments when they include complex metaphors and humour when compared to instructor grading (Reilly, Stafford, Williams, & Corliss, 2014). Finally, not the types of assessment, but the design and clarity of assessment, are important. For instance, poorly designed assessments decrease students' attention to the topic (Zutshi et al., 2013).

# **Process Factors**

# Learning Activities

In MOOC environments, understanding the learners' activities is mostly limited by log and clickstream analysis. For instance, Liang et al. (2014) analysed students' learning records using data mining technology to discover students' learning outcomes. Other researchers, however, have attempted to use qualitative data in order to reach the answer the question of how learners approach their tasks in MOOC environments. Veletsianos et al. (2015) distinguished four categories of students' activities in MOOCs: (1) digital activities, which mostly occur in outside MOOC platforms such as social networking sites, (2) non-digital activities such as note taking, (3) social activities, and (4) individual activities such as locating a study space at home.

Based on the reviewed studies, it can be concluded that there are various learning activities. Firstly, there is a need for equilibrium between collaborative and individual work. For instance, in cMOOC environments, students' learning approaches are oriented towards collaborative learning such as sharing, creating, and making mutual ways for learning

instead of following individual paths (Bali, Crawford, Jessen, Signorelli, & Zamora, 2015). Findings also showed that, apart from collaborative learning, query- and game-based learning also are highly preferred learning approaches in MOOCs (Chang, Hung, & Lin, 2015). Some studies indicated that learning activities are mainly structured on principles of selfdirected learning (Bonk, Lee, Kou, Xu, & Sheu 2015; Hew & Cheung, 2014). Learning routines can help students build confidence, which in turn fosters commitment to the course (Castaño-Garrido et al., 2015). Thus, the amount of collaborative and individual learning activities should be balanced since too many collaborative activities might make students feel frustrated and contribute to incomplete submissions that result in dropout (Saadatmand & Kumpulainen, 2014).

Secondly, both synchronous and asynchronous learning activities should be balanced since learners might have some difficulties following synchronous activities. Thirdly, a robust balance between active learning and reproductive learning activities should be created. For instance, Miller (2015) suggested that active learning activities help students engage with course content easily while other studies have indicated that the opportunity to work on practical examples provides meaningful learning by requiring learners to apply theoretical knowledge (Park, Jung, & Reeves, 2015; Stefanic, 2014).

# **Product Factors**

# Engagement

Coates (2006, p. 122) defines engagement as encompassing "the active and collaborative learning, participation in challenging academic activities, formative communication with academic staff, involvement in enriching educational experiences, and feeling legitimated and supported by university learning communities." In online education, active and authentic learning environments, interactive learning activities, and learner-centred communities provide the foundation for a high level of student cognitive engagement (Katuk & Kim, 2013).

In MOOCs, engagement refers to learner participation with peers, instructors, and materials on the network/web. Interaction, an active learning environment, as well as clear instructions and guidance are effective for increasing student engagement in MOOCs (Chang et al., 2015). Participation and engagement in MOOCs can have different forms as students' interaction with MOOC resources happens at various times, in unique orders, and in different amounts (DeBoer et al., 2014). Thus, different forms of participation and engagement should be taken into consideration while developing MOOC curriculums, teaching-learning activities, organizing learning environments, and creating assignments to increase the quality of learning outcomes in MOOCs (Ahn, Butler, Alam, & Webster, 2013).

## Achievement

Academic achievement can be defined as fulfilling course requirements and making satisfactory progress on the way to receiving a diploma. However, this might manifest quite differently in MOOCs since there is still disagreement on appropriate measures of academic achievement between MOOC researchers and providers (Hew & Cheung, 2014). When MOOCs are considered as an open and large-scale course context, course certification rates can be misleading and counterproductive indicators of their real impact and potential.

Likewise, it may not be useful to evaluate students' achievement with traditional metrics and methods. The definition of student success might be reformulated in terms of if students are able to reach their own goals or realize their own intentions (DeBoer et al., 2014; Ho et al., 2014). Furthermore, Ho et al. (2014, p. 2) specifically stated that "Pressure to increase certification rates may decrease the impact of open online courses, by encouraging instructors and administrators to suppress or restrict registration, lower certification standards, deemphasize recruitment of target subpopulations, or disregard interventions that may disproportionately increase numbers of non-certified registrants over certified registrants".

The current review showed that being assignment-oriented and well-structured, having sequential course structure and well-designed assessments, task-oriented MOOCs, small cMOOCs, as well as the quality of materials (e.g., videos) are important portents of student success (Forsey, Low, & Glance, 2013). Mainly, assignments play a significant role in students' achievement. For instance, Daza, Makriyannis, and Rovira Riera (2014) revealed that learning tasks *called challenge–lesson–resolution*, which introduce simple real-life problems to students that are then explained and solved during the lesson, can help students comprehend course content.

Apart from the underlying course design, some key features of courses positively affect students' achievement. For instance, group projects, e-learning activities, tutorials and online quizzes, discussion sessions such as *brain rewiring*, which require students to post daily positive experiences, result in increased student success (Al-Atabi & DeBoer, 2014). In addition, integrating other social media tools (e.g., Skype, Facebook, Google+) that enable students to work col-

laboratively with discussion boards and blogs are also effective for ameliorating students' understanding and success (Comer et al., 2014; Firmin et al., 2014; Zutshi et al., 2013).

Moreover, instructor support (e.g., providing feedback) of student effort, which increases course engagement, may have a substantial positive impact on achievement in MOOCs (Hernández-Carranza, Romero-Corella, & Ramírez-Montoya, 2015). Some studies pointed that participation, motivation, intention to complete the course, and level of course satisfaction are all related to students' achievement (Castaño-Garrido et al., 2015; Liyanagunawardena, Lundqvist, & Williams, 2015; Milligan et al., 2013).

## Attrition

The dropout rate is a critical issue in the MOOC literature. Thousands sign up for courses, but a very small percentage finish with a passing grade. The literature showed that notwithstanding the huge enrolment rate of MOOCs, the retention rate is generally quite low (Jordan, 2014). The vast gap between enrolment and completion is caused by several factors such as 'lack of time,' 'bad time management,' and 'limited time-on-task' (Fini, 2009; Liu et al., 2014).

Some course design features are understood as strong predictors of student retention in MOOCs (Castaño-Garrido et al., 2015; Macleod, Haywood, Woodgate, & Alkhatnai, 2015). For instance, courses with flexible structure, support from and monitoring by the instructor, high student cognitive engagement, and high quality course materials positively influence student retention (Campbell et al., 2014; Hernández-Carranza et al., 2015; Liu et al., 2014; Yang, Wen, Kumar, Xing, & Rose, 2014). Finally, Perna et al. (2014) suggested that attending the first lecture and the first quiz are two significant predictors of course completion.

# **Discussion and Conclusion**

It is clear that research on MOOCs is undergoing rapid development. As this review underlines, there is a new growing body of empirical research that supports the notion that instructional quality and learning analytics play a significant role in the MOOC phenomenon. Criticisms of MOOCs regarding their low completion rates, lack of pedagogical infrastructure, and unreliable assessment methods have led recent research to focus on students' learning outcomes in MOOCs (Mackness & Bell, 2015). Thus, knowing more about what and how students learn would provide data for designing ways to address the challenges faced in MOOCs. As called for by many researchers, the current study aimed to explore MOOCs by examining factors involved in students' learning outcomes (Castaño-Garrido et al., 2015; Reich, 2015). Thus, literature on MOOCs was reviewed to identify students' characteristics, course features, and learning processes related to significant learning outcomes. The selected studies were systematically analysed with respect to the components of Biggs (2003) 3P model. The students' characteristics, teaching context, and learning activities related to students' learning outcomes (*see* Fig. 2.) were synthesized in order to formulate a set of suggestions for designing significant learning outcomes in MOOCs. Applying the following suggestions for the design of MOOCs might be beneficial to both MOOC providers and instructors:

- Ensure that all students with different personal and academic characteristics are able to follow the course information. Conducting need assessment could be helpful to identify the students' needs, preferences, and expectations as a basis for organizing course design. For instance, students who have prior experience with online learning might be more active and ready to participate in open online courses compared to those who have no or limited experience.
- Course resources and tools should encourage students to participate. These may include social networking tools, authentic tasks, project-based assignments, and collaborative projects.
- Providing unique features (e.g., authentic e-learning activities) within the courses increases students' commitment and participation.
- Use peer and self-assessment for formative evaluation in conjunction with rubrics or other form of guidance to improve both students' learning and the accuracy of their assessments.
- Provide clear and structured assessments, and design the assessments by taking into account the students' profile and preferences in order to capture the students' attention.
- Ensure that feedback is personalized and contextualized to stimulate students' participation and engagement.
- Facilitate learner-centred communities using group projects or collaborative study groups to encourage students' participation and engagement.
- Provide opportunities for students to contribute in discussion forums and blogs in order to sustain their motivation to participate and complete the course.
- Ensure that MOOCs are prepared based on a well-structured instructional design models that include learning

0

tasks, quality materials (e.g., videos) and tools, SNSs, aligned assessments, and personalized learning environments.

- Provide opportunities for students to manage their own time in order to develop their intrinsic motivation and commitment to the course.
- Ensure that the duration of the course is no longer than 8 weeks; students tend to remain in and complete shorter MOOCs.
- Provide alternatives for students to accredit MOOCs to increase the retention. There should be an option to transfer credits from MOOCs into institutional degree programs.
- Foster self-directed learning environments to expand students' autonomy, encourage them to complete their weekly assignments, and provide opportunities for students with limited computer and language skills.

Based on the current review study several conclusions can be highlighted. Firstly, the MOOC studies reviewed reinforce the message that proper course design, which considers students' individual differences and intentions, may provide a solution to current problematic issues that make the higher education committee sceptical of MOOCs. No one denies the reality that the mounting MOOC phenomenon brings vital change and development to higher education, but this innovation must not change the real purpose of providing effective learning environments. Therefore, the needs and requirements of those who follow and lead MOOCs should be fulfilled by MOOC providers to continue their existence and enhance efficiency. It is further important to note that these needs and requirements are evolving and changing in very different patterns compared to traditional education (DeBoer et al., 2014; Liyanagunawardena et al., 2015).

Secondly, there is widespread agreement that students' learning outcomes are more difficult to explore and analyse in open online learning environments than in campus environments because of the difficulty, discrepancies, and fertility of data in open online learning environments. More research is needed to fully comprehend factors related to significant learning outcomes in MOOCs by conducting research that goes beyond counting 'clicks.'

Thirdly, this review study revealed that there are many MOOCs without sufficient pedagogical infrastructure. Although teaching and learning practices including instructional design, teaching materials, and assessment might be problematic, many students who participated in MOOCs especially in miniMOOCs expressed a high level of satisfaction (Khalil & Ebner, 2013). Even more surprisingly, this positive attitude towards MOOCs is not related to course completion (Mackness & Bell, 2015). Some distance education researchers claim that the MOOC phenomenon is just a fad that will never challenge or alter in-class higher education and that they are going to lose their popularity in the near future. Other researchers, however, claim that MOOCs will continue to provide new insights and opportunities for higher education.

MOOCs promote a great opportunity for lifelong learning (Liyanagunawardena, 2015; Macleod et al., 2015; Milligan & Littlejohn, 2014; Steffens, 2015). Albeit that students differ in reasons why they attend a MOOC (e.g., lifelong learning, personal development or credits), MOOCs should be developed on the basis of instructional design models. To this end, the set of implications mentioned above which were based on empirical findings from the literature, offers an opportunity to develop open online courses for significant students' learning outcomes.

## Implications for Future Work

Although the research literature defines general issues that could be addressed in research on MOOCs, only a few studies focused on teaching and learning aspects. More research is needed on how MOOCS impact students' learning outcomes and performance, and their connection with aspects of instruction and teaching. Finding ways to increase student' completion rates would not automatically translate to definitely establishing the quality of MOOCs. Like in face-to-face education, passing rates are not always good indicators of students' meaningful learning. This means that MOOC stakeholders must develop additional indicators of MOOC quality.

Firstly, we suggest investigating issues related to pedagogical aspects of MOOCs, such as how to align with students' needs and how various course designs (e.g., personalized learning, e-activity-based learning, game-based learning, and project-based learning) impact students' engagement, satisfaction, achievement, and retention rates in MOOCs. One of these pedagogical aspects is feedback. Timely feedback that is formulated to be "to the point" is positively related to students' meaningful learning and future research could investigate how to incorporate this kind of feedback into MOOCs.

Secondly, we suggest examining alternative assessment methods that are aligned with learners' needs and motivations, and to also assess aspects of performance that are more relevant for MOOC platforms (e.g., collaboration, openness, active involvement) compared to traditional learning environments.

Thirdly, it might be useful to examine the differences in learning outcomes of experienced and novice MOOCers, and how these differences are related to the learning behaviors they exhibit during a MOOC. Experience could also be a research topic in terms of the instructors to examine differences between experienced and novice MOOC instructors.

Fourthly, further research could focus on testing hypothetical relationships between students' characteristics, course features, learning and teaching activities, and students' learning outcomes in MOOCs. This kind of research can support teachers and designers in decisions regarding how to plan MOOC components.

# Appendix I. Summary of reviewed studies.

| No | Author/Date                                  | Purpose  | Research<br>question(s)   | Methodology   | Sample  | Results  | Implications for future research   | Implications<br>for practice  |
|----|--|--|---|---|---|--|--|---|
| 1  | Adams, Yin,<br>Madriz, & Mullen<br>(2014)    | Examine the<br>students' accounts<br>of their everyday<br>experiences of<br>learning in<br>MOOCs.                                      | What are<br>completers'<br>experiences of<br>learning in an<br>xMOOC?   | Qualitative<br>research<br>methodology,<br>phenomenology<br>of practice | 4 current<br>participants in<br>MOOC and 6<br>MOOC completers   | Intimacy developed<br>for xMOOC<br>instructor, most<br>especially in the<br>context of the<br>pre-recorded<br>instructional videos   | Need to explore<br>the everyday<br>activities of<br>xMOOC students   | Using video in<br>xMOOC can be<br>helpful to develop<br>engagement both<br>to the course and<br>instructor.   |
| 2  | Admiraal,<br>Huisman, & Van<br>de Ven (2014) | Examine the<br>quality of self- and<br>peer assessments<br>in three MOOCs.   | <ol> <li>What is the<br/>reliability of<br/>self- and peer<br/>assessment<br/>implemented in<br/>MOOCs?</li> <li>What is the<br/>relationship<br/>between self-<br/>and peer assess-<br/>ment and<br/>quizzes?</li> <li>To what extent<br/>do self- and<br/>peer assessment<br/>and quizzes<br/>explain<br/>differences in<br/>students' final<br/>exams scores?</li> </ol> | Case study  | Students from<br>three MOOCs from<br>Leiden University:<br>The Law of the<br>European Union:<br>An Introduction<br>and Terrorism and<br>Counterterrorism:<br>Comparing theory<br>and practice | No significant<br>correlation<br>between the<br>students' peer and<br>self- assessment,<br>self-assessments<br>might not be a<br>valid way to assess<br>students'<br>performance in<br>MOOCs | The reliability of<br>self- and peer-<br>assessment should<br>be conducted in<br>more learner-<br>centred MOOCSs<br>pedagogy. Need<br>to have new<br>metric to consider<br>the relationship<br>between self- and<br>peer assessment. | Self-assessments<br>and peer<br>assessments<br>should be<br>improved if they<br>are used as<br>summative<br>indicators of one's<br>achievements<br>(assessment of<br>learning). |
| 3  | Ahn, Butler, Alam,<br>& Webster (2013)       | Understand the<br>notions of learner<br>participation and<br>engagement in<br>open online<br>courses.                                  | How have learners<br>participated and<br>engaged with<br>open online<br>learning in P2PU?   | Case study  | Dataset from<br>entire history of<br>P2PU   | Participation and<br>engagement take<br>on varied forms in<br>cMOOCs   | Examine<br>longitudinal<br>patterns of the<br>learning tasks of<br>P2PU members,<br>the relationship<br>between factors<br>such as course<br>design, social<br>interaction,<br>dropout and<br>retention                              | Course,<br>assessment, and<br>learning<br>environment must<br>be developed<br>considering the<br>engagement and<br>participation<br>patterns.                                   |
| 4  | Al-Atabi &<br>DeBoer (2014)                  | Explore the<br>students' learning<br>achievement<br>outcomes in<br>entrepreneurship<br>course as a<br>MOOC.                            | What is the<br>effectiveness of<br>using the MOOC<br>to teach<br>entrepreneurship?  | Case study/<br>Survey   | 80 students   | MOOC is a<br>suitable platform<br>to students'<br>collaborative<br>learning,<br>opportunity<br>recognition and<br>resource<br>acquisition.   | Not provided   | Brain rewiring<br>exercises is a good<br>way to initiate<br>discussions among<br>students.  |
| 5  | Bali et al. (2015)                           | To provide<br>insight into the<br>thrill and depth<br>of learning and<br>connection<br>possible through<br>participation<br>in cMOOCs. | Not provided  | Collaborative<br>autoethnography  | Five cMOOCers   | MOOCs are the<br>mentalequivalent<br>of working on<br>a 3D puzzle<br>that is in<br>constant<br>motion rather<br>than a static<br>workbook.   | Not provided   | MOOCs are a<br>good way to<br>develop or hone<br>digital literacies.  |

| No | Author/Date   | Purpose  | Research<br>question(s)  | Methodology  | Sample  | Results  | Implications for future research  | Implications<br>for practice  |
|----|---|--|--|--|---|--|---|---|
| 6  | Bonk et al. (2015)  | To explore the<br>self-directed and<br>informal learning<br>experiences of<br>subscribers to the<br>monthly MIT<br>OpenCourseWare<br>(OCW) online<br>newsletter. | Not provided   | Survey   | 1429 people   | Motivational factors<br>are curiosity, interest,<br>and internal need for<br>self-improvement.<br>Success or personal<br>change factors<br>included freedom to<br>learn, resource<br>abundance, choice,<br>control, and fun.<br>In terms of<br>achievements,<br>respondents were<br>learning both<br>specific skills as well<br>as more general skills<br>that help them<br>advance in their<br>careers. | Not provided  | Educators,<br>instructional<br>designers, and<br>online learning tool<br>and resource<br>designers need to<br>embed a sense of<br>choice and control<br>when creating or<br>enhancing OCW,<br>OER, and MOOCs. |
| 7  | Breslow et al.<br>(2013)  | Understand the<br>modes of learning<br>which work well<br>under the specific<br>situations of<br>6,002x MOOC?  | Who the students<br>were in 6.002x?,<br>how they utilized<br>course resources?,<br>what contributed to<br>their persistence?,<br>and what advanced<br>or hindered their<br>achievement?  | Case study   | Data set of<br>155,000 people<br>who enrolled<br>6.002x   | The certificate<br>earners used the<br>forum at a much<br>higher rate than<br>other students. High<br>achievers are<br>studying offline with<br>another person.<br>Positive relationship<br>between highest<br>degree earned<br>and achievement  | How different<br>representations of<br>complex concepts<br>and phenomena<br>(textual, graphical,<br>mathematical) can<br>best be used to<br>help students<br>master them? | Collaborating with<br>another person,<br>whether novice or<br>expert, strengthens<br>learning   |
| 8  | Campbell,<br>Gibbs, Najafi, &<br>Severinski (2014)              | Explore and<br>compare the<br>demographics,<br>intent, and<br>behavior differ-<br>ences of live-and<br>archived-learners.  | Are there any<br>potential and<br>purpose for<br>archived MOOCs<br>to be used as<br>learning resources<br>beyond and<br>between<br>instructor-led<br>live-sessions?  | Survey, activities<br>and clickstream<br>of all learner<br>actions | Learners in the<br>live- and<br>archived-sessions<br>of "Statistics:<br>Making Sense of<br>Data" (STATS) and<br>"Learn to Program:<br>The Fundamentals"<br>(LPT1) | The archived-<br>learners interact<br>with the course in<br>much the same<br>way as live-learners.<br>Learners follow the<br>course sequentially<br>who intended to<br>complete all<br>required work.  | Exploration of the<br>pace at which<br>archived-learners<br>access videos<br>and complete<br>assessments may<br>have valuable<br>implications for<br>course design.       | MOOCs to be<br>beneficial as<br>self-study courses,<br>students in<br>archived-MOOCs<br>have potentials<br>to fulfill students'<br>needs.   |
| 9  | Castaño-Garrido,<br>Maiz-Olazabalaga,<br>& Garay-Ruiz<br>(2015) | Focus on the<br>pedagogical<br>design of a<br>cooperative<br>MOOC and its<br>influence on<br>motivation and<br>academic results                                  | <ol> <li>Is there a<br/>relationship<br/>between<br/>academic<br/>performance and<br/>the pedagogical<br/>design of the<br/>course?</li> <li>Is there a<br/>relationship<br/>between student<br/>motivation and<br/>the pedagogical<br/>design of the<br/>course?</li> <li>Is there a<br/>relationship<br/>between<br/>academic<br/>performance and<br/>student<br/>motivation?</li> </ol> | Survey, analyzing<br>of e-activities                               | 186 participants of<br>744 students who<br>enrolled on the<br>MOOC  | Course design<br>(cooperative and<br>social network<br>learning) influences<br>students'<br>performance.<br>No global<br>significance<br>between motivation<br>and performance,<br>but positive<br>relationship<br>between satisfaction<br>and performance   | How is the<br>relationship<br>between academic<br>performance and<br>students' learning<br>experiences?   | Increase the level<br>of student<br>satisfaction can<br>help to cut<br>dropout rates.<br>Course design<br>should be<br>integrated with<br>students'<br>motivational<br>factors.                               |

| No | Author/Date                                    | Purpose   | Research<br>question(s)   | Methodology                         | Sample  | Results   | Implications for future research  | Implications<br>for practice  |
|----|--|---|---|-------------------------------------|---|---|---|---|
| 10 | Chen & Chen<br>(2015)                          | Investigate the<br>effectiveness and<br>sustainability of<br>face-to-face study<br>groups for<br>MOOCs.   | RQ1: What are<br>MOOC students'<br>perceived gains<br>from the face-to-<br>face study group?<br>RQ2: What are the<br>key factors that<br>influence the<br>dynamic/<br>effectiveness of the<br>MOOC study<br>group? RQ3:<br>What are MOOC<br>students'<br>suggestions to<br>improve the face-to-<br>face study group?  | Interpretive case<br>study approach | Four audiences<br>who attended a<br>2-h guest speech<br>entitled "From<br>OCW to MOOCS:<br>Implication for<br>college students" | Cognitively,<br>participants<br>broadened their<br>perspective of<br>thinking, raised<br>cultural awareness,<br>and shared many<br>learning strategies  | To explore study<br>group dynamics,<br>perceived gains<br>and challenges,<br>and key influential<br>factors across<br>culture.  | Study group may<br>serve as an ideal<br>approach to help<br>MOOC learners<br>develop requisite<br>skills, share feelings<br>and thoughts, and<br>strengthen their<br>self-determination<br>to continue. |
| 11 | Chang et al.<br>(2015)                         | Explore whether<br>learning styles can<br>influence the use<br>of MOOCs and<br>determine the<br>learning style<br>related to use<br>intentions. | Not provided  | Survey                              | 184 undergraduate<br>students   | Innovative learning<br>styles influence<br>the learning<br>experience in<br>MOOCs.  | Increase the<br>sample size and<br>include more<br>important personal<br>traits to enhance<br>the effect of<br>personalized<br>learning in MOOCs.   | Collaborative, game-<br>based and query-<br>based learning<br>should be taken into<br>account for<br>increasing the quality<br>and enrolment of<br>MOOCs.   |
| 12 | Comer, Clark, &<br>Canelas (2014)              | Evaluate how<br>peer-to-peer<br>interactions<br>through writing<br>impact student<br>learning in<br>introductory-level<br>MOOCS.                | <ol> <li>How do peer-to-<br/>peer interactions<br/>through writing<br/>impact student<br/>learning in<br/>introductory-level<br/>writing and<br/>chemistry<br/>MOOCs?</li> <li>What is the<br/>impact of peer-to-<br/>peer writing on<br/>engaging<br/>students in MOOC<br/>coursework who<br/>identify as less<br/>academically-<br/>prepared and less<br/>self-motivated?</li> <li>How can peer-to-<br/>peer writing<br/>function as a<br/>metric to assess<br/>student success in<br/>MOOC delivered<br/>introductory<br/>writing and<br/>science<br/>coursework?</li> </ol> | Qualitative<br>coding analysis      | English<br>Composition I:<br>Achieving Expertise<br>and Introduction to<br>Chemistry  | Peer-to-peer<br>interactions in<br>writing through<br>the forums and<br>through peer<br>assessment<br>enhance learner<br>understanding, link<br>to course learning<br>objectives, and<br>generally<br>contribute<br>positively to the<br>learning<br>environment. | Not provided  | The peer-feedback<br>process, discussion<br>forums, and<br>writing through<br>the forums con-<br>tribute to students'<br>learning, especially<br>in understanding.                                      |
| 13 | Daza, Makriyannis,<br>& Rovira Riera<br>(2014) | Create a useful<br>tool for students<br>that enter<br>university.   | Not provided  | Survey                              | 194 students  | Not provided  | To collect more<br>data at the end of<br>the academic year.<br>We would like to<br>know whether this<br>year's students will<br>be more successful<br>with linear algebra<br>compared with<br>previous years. |   |

| No | Author/Date                          | Purpose  | Research<br>question(s)   | Methodology    | Sample  | Results   | Implications for future research  | Implications<br>for practice   |
|----|--------------------------------------|--|---|----------------|---|---|---|--|
| 14 | DeBoer et al.<br>(2014)              | Propose the<br>redefine the some<br>conventional<br>variables: enrollment,<br>participation,<br>curriculum, and<br>achievement to be<br>useful for<br>description and<br>evaluation of the<br>educational<br>experience in<br>MOOCs.             | Not provided  | Data analyzing | Data from the first<br>MOOC offered by<br>MIT, "Circuits and<br>Electronics"                                | Reconceptualization<br>of conventional<br>variables in terms<br>of individualized<br>and informed user<br>intentions  | Analysis and<br>mining of log files<br>to identify the<br>actions users are<br>taking, may also<br>surface the<br>intentions of the<br>students.                | Not provided   |
| 15 | de Freitas et al.<br>(2015)          | Explore how<br>course retention<br>can be improved<br>in online provision.   | <ol> <li>How did<br/>students view<br/>the course after<br/>completing it?</li> <li>What were the<br/>main retention<br/>patterns of<br/>students?</li> <li>How did student<br/>activity relate to<br/>final grade?</li> <li>Did the quality<br/>of the MOOC<br/>and its links to<br/>Astronomy<br/>degree level<br/>education have<br/>an impact upon<br/>retention?</li> <li>Did the role of<br/>"gamified"<br/>elements have<br/>an impact upon<br/>engagement<br/>and retention?</li> </ol> | Case study     | Students in<br>Astronomy MOOC   | Higher levels of<br>engagement,<br>creativity and<br>experimentation<br>can be used to<br>decrease the of<br>high dropout<br>rates.   | Not provided  | Experience<br>presenting video<br>and audio<br>materials,<br>activities including<br>interactive media,<br>quizzes and<br>assignments,<br>and for social<br>interactions<br>should be in<br>MOOCs. |
| 16 | Dillahunt, Wang, &<br>Teasley (2014) | Compare the<br>MOOC learners<br>who self-identified<br>as being unable to<br>afford to pursue a<br>formal education<br>(the target group)<br>with other learners<br>(the comparison<br>group) in terms of<br>demographic data<br>and motivation. | How MOOCs<br>might better serve<br>those who feel<br>financially unable<br>to pursue a more<br>traditional path<br>to post-secondary<br>education studies?  | Survey         | Six Coursera<br>MOOCs related<br>with Humanities,<br>Economics and<br>Finance, and<br>Technology,<br>N=3812 | There were no<br>significant<br>differences between<br>the two groups'<br>engagement in<br>terms of watching<br>videos, accessing<br>course materials<br>and/or conducting<br>assessments. The<br>comparison group<br>had a higher<br>percentage of<br>course completion<br>but the<br>achievement level is<br>significantly high in<br>target group. | Whether and how<br>MOOC platforms<br>can capture more<br>detailed<br>information about<br>learners during<br>their activity and<br>engagement in<br>the courses | Students who have<br>educational<br>affordability are<br>more likely to earn<br>a certificate with<br>distinction than<br>those who enrolled<br>in the MOOC for<br>reasons other<br>reasons.       |
| 17 | Diver & Martinez<br>(2015)           | Investigate<br>dropout rates and<br>how students who<br>decide to drop out<br>differ from those<br>who continue<br>courses.  | Not provided  | Data analysis  | MOOC data from<br>two Coursera  | Procrastination, as<br>measured by<br>delays in taking<br>quizzes is negatively<br>correlated with<br>achievement on<br>quizzes.  | Determine how<br>students change<br>behavior when<br>they are offered<br>certificates of<br>different values.   | Establishing or<br>altering deadlines<br>or sending<br>students almost<br>costless emails to<br>reduce<br>procrastination  |

| No | Author/Date                       | Purpose  | Research<br>question(s)  | Methodology                                       | Sample   | Results  | Implications for future research  | Implications<br>for practice   |
|----|-----------------------------------|--|--|---|--|--|---|--|
| 18 | Fini (2009)                       | Investigate lifelong<br>learners attitudes<br>towards learning<br>network<br>technologies.                                     | What are the<br>learners' views<br>about the multi-tool<br>environments in<br>CCK08 cMOOC?   | Survey  | Eighty-three<br>students in<br>cMOOC (49 males,<br>34 females) | Various opinions<br>about the tools<br>related with needs,<br>purposes and self-<br>organization skills.<br>Social networks<br>that were external<br>to the course was<br>perceived as<br>unnecessary.   | Issues related to<br>sustainability and<br>the workload of<br>instructors should<br>be studied.   | Use of unique tools<br>and/or activities<br>such as The Daily<br>can be a useful<br>tool for learning.   |
| 19 | Firmin et al.<br>(2014)           | Identify reasons<br>for students'<br>achievement and<br>to discover<br>patterns to inform<br>future online<br>course planning. | <ol> <li>Who engaged<br/>and who did not<br/>engage in a sus-<br/>tained way and<br/>who passed or<br/>failed in the<br/>remedial and<br/>introductory<br/>AOLE courses?</li> <li>What student<br/>characteristics and<br/>use of online<br/>material and<br/>support services<br/>are associated<br/>with success?</li> <li>What do key<br/>stakeholders<br/>(students, faculty,<br/>online support<br/>services, and<br/>leaders) tell us<br/>they have learned<br/>from the AOLE<br/>experiment?</li> </ol> | Case study  | 213 students in<br>SJSU Plus by<br>Udacity                     | Student effort<br>was the strongest<br>success indicator,<br>suggesting<br>criticality of early<br>and consistent<br>student<br>engagement.<br>No statistically<br>significant<br>relationships with<br>student<br>characteristics<br>(age and gender)<br>were found.<br>AOLE support<br>effectiveness was<br>compromised<br>with staff time<br>consumed by the<br>least prepared<br>students. | How some factors<br>(e.g. early support,<br>high degree of<br>structure and use<br>of learning<br>analytics) are<br>related with<br>students'<br>engagement and<br>persistence in<br>MOOCs. | Matriculation of<br>students and soft-<br>ware development<br>for early warning<br>to students can<br>increase the<br>achievement,<br>contextualization<br>of MOOCs<br>provides more<br>advantage for<br>both engagement<br>and authentic<br>learning. |
| 20 | Forsey, Low, &<br>Glance (2013)   | Critically<br>re-examine<br>pedagogy and<br>practice in the<br>sociology<br>classroom  | How is the<br>pedagogy and<br>practice in sociology<br>flipped classroom<br>with MOOC?   | Survey and<br>focus group<br>interviews           | 74 completed<br>surveys  | Students were<br>experienced an<br>increase in the<br>amount of learn-<br>ing time, materials<br>were clear and<br>well-structured in<br>MOOC platform.  | Not provided  | MOOC can be an<br>good alternative<br>for blended<br>learning.   |
| 21 | Fournier, Kop, &<br>Durand (2014) | Explore the<br>CPLENK MOOC,<br>and to highlight<br>the challenges in<br>the research and<br>analyze process.                   | What are the<br>learning and<br>activity levels in an<br>open learning<br>environment ?  | Qualitative and<br>quantitative-<br>survey method | PLENK participants   | Motivation, past<br>experienced and<br>reflective are three<br>factors to self-<br>directed learning.<br>"Freedom to do<br>and read as I felt<br>like" and "how<br>the course<br>organized" are the<br>two main factors<br>on learning.  | Usefulness of the<br>tools that help<br>students to<br>develop self-<br>directed learning   | The importance of<br>human factors<br>such as motivation,<br>incentives, support<br>in creating high-<br>quality learning<br>experiences in<br>MOOC  |
| 22 | Gillani & Eynon<br>(2014)         | Understand the<br>ways that learners<br>from around the<br>world interact in<br>MOOCs.   | <ol> <li>What are the<br/>demographic<br/>characteristics of<br/>students that<br/>participate in<br/>MOOC discussion<br/>forums?</li> <li>What are the<br/>discussion<br/>patterns that<br/>characterize their<br/>interactions?</li> <li>How does<br/>participation in<br/>discussion forums<br/>relate to students'<br/>final scores?</li> </ol>  | Case study,<br>survey                             | 87,000 individuals<br>from one MOOC                            | Forum participants<br>tend to be well-<br>educated adults<br>from the Western<br>world. Engaged<br>students in the<br>discussion forums<br>are often higher-<br>performing than<br>those that do not,<br>although the huge<br>majority of forum<br>participants receive<br>"failing" marks.  | How MOOC<br>participants use<br>the discussion<br>forums? How<br>learning occurs in<br>MOOC using both<br>qualitative and<br>quantitative<br>methods?                                       | Higher-performing<br>students use the<br>discussion forums,<br>but they do not<br>only interact with<br>other higher-<br>performing<br>students.   |
