**Title:** Impact of nitrogen fertilization on the soil microbiome and nitrous oxide emissions **Issue Date:** 2019-04-17

#### **Propositions**

### Propositions associated with the PhD thesis **"Impact of nitrogen fertilization on the soil microbiome and nitrous oxide emissions"** Noriko A. Cassman Leiden, 17<sup>th</sup> April 2019

- 1. The diversity of the nitrifying microbial community in Brazilian Oxisol under sugarcane is low due to the low amount of ammonia that is normally present. (this thesis)
- 2. Linking the "black box" of microbial community functions to micro- and macronutrients will help to improve understanding of the soil system. (this thesis)
- 3. Application of -omics to bioethanol production can improve the efficiency of the process by identifying the potential effects of the contaminants. (this thesis)
- 4. To place unknown microbes into context, data obtained from non-reference guided analysis depends on the quality of reference data. (this thesis)
- 5. Not only is science needed to tackle climate change, but also awareness of human lifestyles on the earth at individual, societal and national levels.
- 6. Technology can greatly aid scientific progress but will never supplant the human role, which is to ask questions.
- 7. Progress in any one scientific field engenders progress in unrelated scientific fields.
- 8. Data-driven science should take as example the soil ecosystem with regard to recycling resources.
- 9. Ideals of the international scientific community transparency, collaboration and rigorous standards should be upheld regardless of national scientific policies.
- 10. When writing computer code, ten minutes of thought can be more useful than a day of trial and error. Also, better than a week of trial and error.
