Contents

1	Introduction	1
1.1	Low mass star formation	1
1.2	Disk evolution and planet formation	1
1.2.1	Global evolution	1
1.2.2	Dust evolution	3
1.3	Photodissociation regions	6
1.4	Disk chemistry	7
1.5	Outline of the thesis	9
1.6	Main results of the thesis	11
2	A PDR code comparison study	15
2.1	Introduction	16
2.2	The physics of PDRs	17
2.3	Modeling of PDRs	18
2.4	Description of sensitivities and pitfalls	20
2.4.1	Model geometry	20
2.4.2	Chemistry	21
2.4.3	Heating and cooling	25
2.4.4	Grain properties	26
2.4.5	Radiative transfer	27
2.4.6	Ionization rate	27
2.5	Description of the benchmark models	29
2.5.1	PDR code characteristics	29
2.5.2	Benchmark frame and input values	31
2.6	Results	33
2.6.1	Models with constant temperature F1-F4	34
2.6.2	Models with variable temperature V1-V4	39
2.6.3	Further thermal balance tests	43
2.7	Concluding remarks	45
3	The gas temperature in flaring disks around pre-main sequence stars	53
3.1	Introduction	53
3.2	Calculating the gas temperature	55
3.2.1	The PDR model	55

Contents

3.2.2	Chemistry	57
3.2.3	Thermal balance	59
3.2.4	Dust settling	59
3.3	Results	62
3.3.1	Temperature	62
3.3.2	Chemistry	66
3.3.3	Line intensities	69
3.4	Discussion	69
3.4.1	Limitations of the 1+1-D model	69
3.4.2	Effects of gas-dust coupling	70
3.4.3	Effects of the radiation field	70
3.5	Conclusions	71
	Appendix	75
	A. Heating processes	75
	B. Cooling processes	77
4	Modeling the chemistry of the HD 141569A transitional disk	79
4.1	Introduction	79
4.2	Model	81
4.2.1	Input	81
4.2.2	Treatment of dust	85
4.3	Results	86
4.3.1	Chemistry	86
4.3.2	Temperature	90
4.4	Constraining the gas mass	91
4.4.1	CO lines	91
4.4.2	Other emission lines	94
4.4.3	Gas/dust ratio	94
4.4.4	Second generation gas?	95
4.5	Conclusions	95
5	Chemistry and line emission from evolving Herbig Ae disks	99
5.1	Introduction	99
5.2	Model	101
5.3	Results and discussion	106
5.3.1	Gas temperature	106
5.3.2	Chemistry	107
5.3.3	Column densities	111
5.3.4	Atomic and molecular lines	113
5.4	Conclusions	119
