Author: Chahine, Nadine

Title: Reading Arabic : legibility studies for the Arabic script

Date: 2012-10-25

Reading Arabic

Legibility Studies for the Arabic Script

Proefschrift

ter verkrijging van
de graad van Doctor aan de Universiteit Leiden,
op gezag van Rector Magnificus Prof. Mr. P.F. van der Heijden,
volgens besluit van het College voor Promoties
te verdedigen op Donderdag 25 oktober 2012
klokke 11:15 uur

door

Nadine Chahine

geboren te Beiroet (Lebanon)
in 1978

Promotiecommissie

Promotor: Prof. Dr. h.c. Gerard Unger

Co-promotor: Dr. Kevin Larson (Microsoft Advanced Reading Technologies,
Redmond, WA)

Overige leden: Prof. Dr. Keith Rayner (University of California, San Diego, CA)

Prof. Dr. Petra Sijpesteijn

Dr. Arnoud Vrolijk

Table of Contents

Acknowledgements	7
Glossary	9
Introduction	13
Chapter 1: The Arabic Script	19
Characteristics	19
Basic Elements	20
Cultural Ties	24
Complexity	25
Chapter 2: The Anatomy of the Arabic Script	27
The Aesthetics of Arabic Texts: Manuscript Traditions	27
Early Kufi	27
Naskh	30
Nasta'liq	35
The Aesthetics of Arabic Texts: Typographic Traditions	35
The Rule of Four Plus Extras	35
The Rule of Continuous Pen Movement	41
The Rule of Two	42
Naskh Alignment Zones	43
The Different Typographic Interpretations of Naskh	43
Complexity of Word Formation	45
Stacking Order	45
Traditional Naskh	45
Simplified Naskh	46
Dynamic Naskh	48
Structural Comparison	50
Relationship of Elements	51
Homogeneous and Heterogeneous Letters	54
Letter Frequency in the Arabic Language	55
Why Anatomy	56
Chapter 3: Arabic Typography Today	57
General Picture	60
Close Up: In Books	60

4 Table of Content

Close Up: In Newspapers and Magazines	61
Close Up: In Branding and Advertising	64
Close Up: On Screen	64
Close Up: Multi-Script Families and the Relationship to Latin Type	71
Arabic Letterforms Past and Present	73
Chapter 4: The Design of Afandem	75
Goals	75
Sources of Inspiration	75
The Process of the Design	79
Afandem Traditional	79
Afandem Simplified	84
Afandem Dynamic	86
Designed for Reading	107
Chapter 5: Eye Movement and Legibility Studies	109
The Mechanics of Eye Movement	109
Eye Movement in Reading	110
Tremors, Drifts, Microsaccades	112
Binocular Fixation Disparity	112
Effect of Script on Reading Measures	113
Attention, Perception, and the Parafovea	114
Parafoveal Preview Benefit and Effects	116
Parafoveal-On-Foveal Effects	119
Effect of Age and Reading Skills on Reading Measures	119
Age	119
Reading Skills	120
Effects of Language on Reading Measures	120
Difficulty	120
Word Length	120
Predictability	121
Skipping	121
More on The Linguistic/Conceptual Difficulty of the Text	122
Frequency	122
Effects of Morphology	122
Homographs (Or Ambiguous Words)	123
Eye Movement Control: Where and When to Move the Eyes	124
Overview	124
Reading Models	126
Effects of the Stimulus	130
Manipulation of the Visual Characteristics of Text	130
Reading on Screen	130
Patterns and Features	132
The Question of Word Shape	133
The Legibility of Type	133
Defining Legibility	133
Methods for Measuring Legibility	135
Letter Identification and Different Script Systems	136
Letter Identification and Frequency Channels	138

Letters Identification and Brain Functions	138
Letter Identification as a Measure of Legibility	139
Structure and Word Identification	140
Crowding	141
Letter Superiority vs. Word Superiority: Redefining Legibility	141
Uppercase vs. Lowercase	144
The Effect of Style	145
The Question of Serifs	146
The Effect of the Complexity of the Style	148
The Effect of Typographic Variables	149
Legibility, Complexity, and the Mark of a More Legible Design	151
Chapter 6: Arabic Language and Reading	153
The Morphology and Orthography of the Arabic Language	153
Derivational Morphology: Root + Pattern Model	154
Inflectional Morphology	155
Etymons	156
Homographs	158
Orthography	158
Literature Review of Findings Related to Orthography and Morphology	159
The Nature of the Arabic Spoken and Written Language	159
Learning to Read	160
Effect of Morphology on Reading	161
Frequency Effects	166
Mental Representation of Arabic Words	166
Effect of Orthography on Reading	167
The Role of Vowels and Typeface Legibility	168
Effect of Vowels on Reading Speed and Comprehension	168
Results of Eye Tracking Studies	172
Hemispheric Specialization	174
Legibility Studies for Arabic	176
Conclusions	178
Chapter 7: The Experiment	181
Hypothesis	182
Method	182
Research Method	182
Materials	183
Apparatus	188
Participants	189
Design	190
Procedure	191
Analysis of Eye Tracking Data	193
Pilot Testing	200
Results	200
Reading Time	202
Fixation Duration	204
Number of Fixations	205
Number of Regressions	207

6 Table of Content

Average Distance of Forward Saccades	208
Average Distance of Regressive Saccades	211
Discussion	216
The Effect of Style on Reading Measures	216
The Effect of Vocalization on Reading Measures	216
The Effect of Age on Reading Measures	218
Interactions	218
The Hypothesis Revisited: The Findings	219
The Question of Authenticity	219
Implications for Design and Reading	220
Conclusions	223
Epilogue	227
Summary	229
Summary (Dutch)	231
Appendix	233
Bibliography	241
Curriculum Vitae	255

Acknowledgements

This research would not have been possible without the kind support of many individuals to whom I will always be in debt. I will be forever grateful to Prof. Gerard Unger who was the first to get me interested in legibility studies and who supervised this research; to Dr. Kevin Larson who made it possible for me to put a psycholinguist's hat on and take on experiment design and legibility research; to Dr. Keith Rayner who offered invaluable insights on eye movement data analysis and who also served on my reading committee; to Dr. Arnoud Vrolijk and Dr. Petra Sijpesteijn for their helpful feedback; to my reading committee; to Prof. Frans de Ruiter for the research support; to Samir Sayegh who inspired my love for Arabic typography in 1998 and who has been my mentor ever since; to Rawda High School and the Makkassid School Network (the schools: Khadija al-Kubra, Khalid bin al-Walid, Ali bin Abi-Talib, Omar bin al-Khattab) and its faculty for giving access to their students, their support with the testing, and the advice on grammatical issues related to the test material; to Emile Yacoub for advice on test material selection; to my colleagues at Linotype and Monotype Imaging for all the support during these five years; to Frank Wildenberg for allowing me to switch to part-time work in order to start the PhD research; to Jörg Schweinsberg for giving me the space and time off needed to bring this research to an end and for agreeing to be my paranymph; to Roswitha Ziegler for the support with flexible hours; to Atilla Korap for his support in automated data compilation; to Jan Middendorp for the Dutch translation; to my family and friends without whom I could not have done this and especially to my dad and his wife Iman for all the support through the school testing period; to my sister Nataly for the editing of the dissertation; to my sister Tania for her support on the big day; to Giulia Conforti for her continuous support and for agreeing to be my paranymph; to Samar Maakaron and Tarek Atrissi for the support and design feedback; to Ann Bessemans who was a friend and a classmate to share the good and the bad with; to my friends and followers on Facebook and Twitter for the amazing and heartwarming messages of support; and finally to my late cat Mia, who sat by my side for every single hour of my studies, for 4 of my 5 PhD years.

A Note Regarding Spelling and References

Parts of this dissertation are planned to be submitted to American psychology journals for publication. Because of that, the dissertation follows US English spelling and the reference guidelines and bibliography follow APA (American Psychological Association) guidelines.

About Transliterations

The Arabic names follow the ALA-LC method with the exception of 2 cases: Arabic words that have gone into mainstream English such as Quran, Naskh, and Kufi; and letter names where the Unicode Standard naming has been followed. The latter is due to this researcher's font development habits.

Glossary

Design terms

Axis: The central axis around which letters are built.

Contrast: The difference between the thinnest and thickest parts of characters

Leading: The space between 2 lines of text.

Modulation: The changing thickness of a letter stroke.

Naskh: It is a small script that is characterized by an even distribution of round and straight elements and is quite clear to read and fast to write. Naskh is Arabic for the word copy.

Optical size: How large the typeface appears. In Latin, this is usually indicated by the relation of the x-height to the capitals. The larger the x-height, the larger the optical size is perceived to be.

Spacing: How far or how close the letters sit in relation to one another.

Terminal treatment: How the ending of letter strokes are drawn.

Weight: How heavy the typeface is.

Width: The horizontal proportion of a typeface. This could vary from normal to condensed or extended.

Psychology terms

All definitions are taken from the Penguin Dictionary of Psychology (Reber, Allen, & Reber, 2009).

Analysis of variance: "A statistical method for making simultaneous comparisons between two or more means. An ANOVA yields a series of values (F values) which can be statistically tested to determine whether a significant relation exists between the experimental values."

Between-subjects design: "A research design in which different groups of subjects are run under different conditions."

Confound: "In experimental work, to fail to separate two variables with the result that their effects cannot be independently ascertained. If in an experiment on memory and age all the older participants are female and all the young are male, then the sex and age are "confounded" and the memory data cannot be properly interpreted."

Counterbalancing: "An experimental procedure for controlling irrelevant factors. A good example is fatigue: if a subject is to perform two tasks, x and y, the order of running would be counterbalanced so that fatigue factors were spread equally across both x and y. To wit: one half of the subjects would perform task x first and one half task y first. If the experiment were run so that all subjects performed x first, it would not be possible to tell whether y was more difficult than x or merely that the subjects were getting tired."

Dependent variable: "Any variable the values of which are, in principle, the result of changes in the values of one or more independent variables. In mathematics this notion of dependence is readily represented by an expression of the kind $y=f(x)$, where the values of y are dependent on the values of x. In psychology, the operative principle is that the behaviour of the subject under consideration is (like y) dependent upon the manipulation of some other factors (the analogue of x)."

Descriptive statistics: "A general label for statistical procedures used to describe, organize and summarize samples of data. Basically, a descriptive statistic is a number that represents some aspect of a sample of data."

Fixation (visual, def.): "The orienting of the eyeball so that the projection of the viewed object falls on the fovea and is in focus. The object or location in space is called the fixation point and lies along the fixation line, which can be drawn from the fovea through the pupil to the object."

Greco-Latin square or Orthogonal Latin squares: "A balanced two-way classification scheme in which each condition occurs just once in each row and column... This balancing is often incorporated into experimental designs so that the order of administration of treatments is perfectly balanced across subjects. Two such Latin squares are orthogonal if, when combined, the same pair of symbols occurs only once in the combined square. This composite square is called a Greco-Latin square."

Independent variable: "Any variable the values of which are, in principle, independent of the changes in the values of other variables. In an experiment, any variable that is specifically manipulated so that its effects upon the dependent variables may be observed. Also called the experimental variable, the controlled variable and the treatment variable."

Inferential statistics: "Statistical procedures used to make inferences. Basically, they utilize the mathematics of probability theory to infer or induce generalizations about populations from sample data."

Interaction: Reciprocal effect or influence... In statistical interaction the effects of two (or more) variables are interdependent; e.g. task difficulty and arousal often interact so that increased arousal increases performance on easy tasks but decreases it on difficult tasks."

Main effect: "In statistical analysis of data, the basic relationship between a single independent variable and a single dependent variable."

Null hypothesis: "A hypothesis of no difference, no relationship. In the standard hypothesis-testing approach to science one attempts to demonstrate the falsity of the null hypothesis, leaving one with the implication that the alternative, mutually exclusive, hypothesis is the acceptable one."

Order effects: "Effects that are attributed to the order in which treatments are presented in an experiment. Order effects can confound an experiment and typically counter-balancing procedures are employed as a control."

Regression: "In reading, any eye movement back over material already read. The frequency of such regressions is related to the difficulty of the material and the reading skills of the individual."

Saccade: "A quick eye movement, a jump of the eyes from one fixation point to another. Saccadic movements are seen most clearly during reading and the scanning of visual displays."

Standard deviation: "A measure of the variability of a sample from the mean of the sample."

Standard error of the mean: "The standard deviation of the theoretical sampling distribution of the mean. In practice it is used as an estimate of the degree to which the obtained mean of a sample may be expected to deviate from the true population mean."

Statistical significance: "The degree to which an obtained result is sufficiently unlikely to have occurred under the assumption that only chance factors were operating, and therefore the degree to which it may be attributed to systematic manipulations. The degree itself is typically specified and denoted as probability, e.g. $p < 0.05$ means that the results obtained (or more extreme results) could only have occurred by chance in fewer than 5 cases in 100. The smaller the p value, the more significant the results; that is, the less likely that they occurred by chance."

Within-subjects design: "An experimental design in which each subject is used in all conditions."
