#### Exploring the world of non-coding genes in stem cells and autoimmunity

- The choice of cell type defines the outcome of results, especially for studying non-coding RNAs that are considered more tissue-specific compared to protein coding genes. (this thesis)
- C5T1IncRNA is one of the causative candidate genes in the C5-TRAF1 risk locus, a locus
  associated with Rheumatoid arthritis. (this thesis)
- Deregulated coding genes with nearby-located deregulated non-coding genes may together contribute to disease pathogenesis. (this thesis)
- Investigating epigenetics in disease-specific manners will aid in understanding disease pathogenesis even if the results are 'negative'. (this thesis)
- The enhancer region of Sox2ot plays an important role in influencing Sox2 transcription and may be more important than the Sox2ot transcripts itself. (this thesis)
- 6. Non-coding should not be interpreted as non-important. (*field*)
- 7. Genetic risk loci can pinpoint genes and pathways involved in disease. (field)
- 8. Genetic variation can be predictive of the risk to acquire a disease but does guarantee its development. (*field*)
- Long non-coding RNAs are promising novel therapeutic candidates due to their high tissue specificity. (field)
- Titles of scientific articles should be more carefully selected and should address the content
  of the article.
- 11. Publicly available datasets are of high value to the scientific society.
