Linking soil microbial community dynamics to N₂O emission after bioenergy residue amendments

The study described in this thesis was performed at the Netherlands Institute of Ecology, NIOO-KNAW; the practical work was performed at the Paulista Agency for Agribusiness Technology (APTA), Agronomic Institute of Campinas (IAC) and Netherlands Institute of Ecology (NIOO-KNAW).

Cover picture was taken by Késia Silva Lourenço.

Contents

Chapter 1	General introduction	9
Chapter 2	Recycling bioenergy residues as fertilizer impacts microbial community composition and function increasing N ₂ O emissions	23
Chapter 3	Resilience of the resident soil microbial community to organic and inorganic amendment disturbances and to temporary bacterial invasion	51
Chapter 4	Dominance of bacterial ammonium-oxidizers and fungal denitrifiers in the production of nitrous oxide after vinasse applications	77
Chapter 5	<i>Nitrosospira</i> sp. govern nitrous oxide production in a tropical soil amended with residues of bioenergy crop	105
Chapter 6	General discussion, conclusion and future perspectives	127
