Physiological Synchrony in the Context of Cooperation:

Theoretical and Methodological Considerations

door Friederike Behrens

- 1. Naturalistic games constitute a valuable bridge between lab and field studies, but need thorough investigation on what they measure and how they should be implemented.
- 2. Face-to-face interaction and knowledge about the partner's previous behavior are two separate puzzle pieces that contribute to the success of cooperation.
- Two individuals who show similar patterns in their sympathetic activity are more likely to succeed in working together.
- 4. In the Windowed Cross-Correlation analysis, there is not one optimal choice of parameters from a statistical point of view; each choice constitutes a new hypothesis and asks a different question.
- 5. Social phenomena such as cooperation need to be studied in social interactions acknowledging the back-and-forth dynamics of nonverbal communication.
- 6. Sometimes the words that are not said are the important ones; just like the nonverbal signals that are not directly visible.
- 7. Statistics is not black and white; there are as many 'correct' ways of performing an analysis as you ask statisticians; choose the one you are most convinced of.
- 8. Interpersonal synchrony is studied from different perspectives in a variety of research disciplines; see it as a challenge to cooperate, not to compete.
- PhD candidates work together more successfully when they are out of sync in the emotional rollercoaster of their PhD trajectory.
