Title: The colours of the extreme universe

Issue Date: 2019-01-10

THE COLOURS OF THE EXTREME UNIVERSE

The Colours of the Extreme Universe

Panchromatic studies of star forming galaxies
and accreting black holes

Proefschrift

ter verkrijging van
de graad van Doctor aan de Universiteit Leiden,
op gezag van Rector Magnificus prof.mr. C. J. J. M. Stolker,
volgens besluit van het College voor Promoties
te verdedigen op donderdag 10 January 2019
klokke 11.15 uur

door

Gabriela Calistro Rivera

geboren te Lima, Perú
in 1990

Promotiecommissie

Promotor: Prof. dr. Huub Röttgering

Co-promotor: Dr. Jacqueline Hodge

Overige leden: Prof. dr. Paul van der Werf

Prof. dr. David Alexander (Durham University)

Prof. dr. Marijn Franx

Dr. Vernessa Smolčić (University of Zagreb)

Dr. Rychard Bouwens

ISBN 978-94-028-1344-9

Cover: drawing by Gabriela Calistro Rivera. Two artistic perspectives of a female dancer doing a pirouette. In the front cover the dancer is viewed from above, where the colourful dress and hair movement evokes the main topics of the thesis, colours and galaxies. In the back cover, the dancer is viewed from a perspective at eye-level, where the side view of the dress reveals a galaxy's spectral energy distribution.

*A mi papá,
por su entusiasmo contagioso
por la física y el Universo*

Contents

1	Introduction	9
1.1	The Building Blocks of the Observable Universe	9
1.2	The Panchromatic Nature of Galaxies and AGN	13
1.3	The Epoch of Extreme Galaxy and Black-hole Growth	17
1.4	This Thesis	21
2	The Statistical Frontier: A Bayesian MCMC Approach to Fitting Spectral Energy Distributions of AGN	27
2.1	Introduction	28
2.2	The code AGNfitter	29
2.2.1	Accretion disk emission (Big Blue Bump)	31
2.2.2	Hot dust emission (torus)	31
2.2.3	Stellar emission	32
2.2.4	Cold Dust Emission from Star-Forming Regions	33
2.2.5	Parameter Space	33
2.3	The MCMC Algorithm	33
2.3.1	Emcee	35
2.3.2	Initialization and burn in steps	35
2.3.3	MCMC steps	36
2.3.4	Running AGNfitter	36
2.3.5	Prior on the galaxy luminosity	37
2.3.6	IGM absorption	38
2.4	Analysis of synthetic data	38
2.4.1	Synthetic SEDs	38
2.4.2	Recovery of parameters	40
2.4.3	Posterior PDFs	40
2.4.4	Integrated luminosities	43
2.4.5	Host galaxy properties	43
2.4.6	Spectral energy distributions	45
2.5	A test sample: XMM-COSMOS	45
2.5.1	Type1 and Type2 AGN samples	46
2.5.2	Multi-wavelength coverage	46
2.5.3	Treatment of upper limits	46
2.6	Results and discussion on the test sample	47
2.6.1	Spectral energy distributions for Type1 and Type2 AGN	47
2.6.2	Physical parameters	51
2.6.3	AGN obscuration and classification	54
2.7	Summary and Conclusions	56
3	The Wavelength Frontier: The low-frequency radio window on star forming galaxies and AGN	63
3.1	Introduction	64
3.2	Survey data	66
3.2.1	LOFAR 150 MHz	66
3.2.2	Radio photometry for the Boötes field	66

3.2.3	Optical and Infrared Photometry	69
3.2.4	Far-infrared Photometry: HerMes DR3	69
3.2.5	Redshifts	70
3.3	Sample Selection	71
3.3.1	LOFAR + I-band selection	72
3.3.2	Selection for radio SED construction	72
3.4	Analysis of AGN and SF galaxies with SED-fitting	73
3.4.1	Stellar masses and star-formation rates	75
3.4.2	Classification into AGN and SF galaxies	75
3.4.3	Contamination by Low Excitation Radio Galaxies	78
3.4.4	Comparison of the classification strategy with literature values	78
3.5	The radio SEDs of SF galaxies and AGN	79
3.5.1	Spectral index α_{150}^{1400} – all sources	79
3.5.2	Spectral indices α_{150}^{325} and α_{325}^{1400}	82
3.5.3	Spectral indices α_{150}^{325} , α_{325}^{610} and α_{610}^{1400}	83
3.5.4	Redshift evolution of the spectral curvature	85
3.5.5	Spectral curvature dependence on other properties	87
3.5.6	Comparison with previous spectral index studies	87
3.6	The infrared-radio correlation (IRC)	89
3.6.1	The IRC at 1.4 GHz and its redshift evolution	91
3.6.2	The IRC at 150 MHz and its redshift evolution	94
3.7	The low frequency radio luminosity as a SFR tracer	95
3.8	Summary	96
3.9	Acknowledgements	97
3.A	Luminosity vs redshift dependence of the IRC	101

4 The Resolution Frontier I: Resolving the distributions of CO, dust continuum and stellar emission with ALMA and HST 105

4.1	Introduction	106
4.2	Observations and Imaging	108
4.2.1	Target selection ALMA observations	108
4.2.2	CO(3-2) line detections and continuum	109
4.2.3	Source size estimation	113
4.3	Dynamical constraints to the total gas masses	115
4.3.1	Molecular gas masses	115
4.3.2	CO line kinematics	116
4.3.3	Dynamical Masses	119
4.3.4	Implications on α_{CO} and M_*/L estimates	120
4.4	Distributions of molecular gas, dust continuum and stellar emission	124
4.4.1	Offset distributions of ISM tracers and stellar emission in ALESS122.1	124
4.4.2	Statistical analysis on the relative sizes of dust continuum, molecular gas and stellar emission in SMGs	126
4.4.3	Physical implications of the more extended molecular gas distributions as compared to dust continuum emission	128
4.5	Summary	129
	Acknowledgements	130

5 The Resolution Frontier II: Strong FUV fields drive the [CII]/FIR deficit in $z \sim 3$ dusty, star-forming galaxies	137
5.1 Introduction	138
5.2 Observations and data reduction	140
5.2.1 Sample selection	140
5.2.2 ALMA Band 8 observations	140
5.2.3 ALMA Band 3 observations	141
5.3 Results	141
5.3.1 Image analysis	141
5.3.2 uv -plane analysis	142
5.3.3 [CII] spectra and kinematics	146
5.3.4 Spectral energy distribution modelling	151
5.4 Discussion	151
5.4.1 Comparison with CO (3–2) emission	151
5.4.2 Molecular gas kinematics	153
5.4.3 The resolved [CII]-FIR ratio	154
5.4.4 Comparison with PDR models	156
5.4.5 Origin of the [CII]/FIR deficit	159
5.5 Conclusions	163
5.A Companion sources in LESS 49 field	167
Nederlandse Samenvatting	169
English Summary	175
Resumen en español	181
Publications	187
Curriculum Vitae	189
