# Remote Control

The cancer cell-intrinsic mechanisms that dictate systemic inflammation and anti-tumor immunity

### **About the title and cover**

The systemic effects of cancer are key determinants of disease progression and treatment response. The title of this Ph.D. thesis, 'Remote control', refers to the systemic manipulation ('control') of the immune system by cancer cells, which reaches beyond the tumor microenvironment to distant ('remote') anatomical sites. The genetic makeup of cancer determines the manifestation and outcome of such remote control. An artist's impression of this phenomenon is represented on the cover.

Cover concept and design: Niels Bierens (Instagram: @rommelzolder)

The research described in this thesis was performed at the Division of Tumor Biology and Immunology of the Netherlands Cancer Institute – Antoni van Leeuwenhoek hospital (NKI-AvL), Amsterdam, the Netherlands. This research was financially supported by the European Research Council (ERC Consolidator InflaMet 615300), the Netherlands Organization for Scientific Research (NWO-VICI 91819616), the Dutch Cancer Society (KWF10083; KWF10623) and Onco Institute. The printing of this thesis was financially supported by NKI-AvL and the Leiden University Medical Center (LUMC).
