# Improving Diagnostic, Prognostic and Predictive Biomarkers in Colorectal Cancer

## The role of Proteomics and Stromatogenesis

- I. Early diagnosis of cancer is of pivotal importance to reduce disease-related mortality (This thesis).
- 2. Assessment of the tumor-stroma ratio is a fast, cheap an reliable prognostic biomarker (This thesis).
- 3. Combining vascular invasion with the tumor-stroma ratio selects for a group of patients with very poor prognosis (This thesis).
- 4. Biochemical derangements in the stroma of tumors from patients with aggressive colon cancer consists among others of increased activation of VEGFR-2 (This thesis).
- 5. New technological developments in the field of clinical proteomics are necessary for implementing this technique into routine personalized clinical practise.
- 6. Further unravelling biological differences, interconnections and changes in the tumor stroma tissue of every individual tumor is important to optimize tailored treatment for colorectal cancer patients.
- 7. Stromal matrix formation might be an important factor to predict therapy response.
- 8. Artificial intelligence, automation and deep learning can bring tumor stroma research to a next level.
- 'Research is to see what everybody else has seen and to think what nobody has thought.' (Albert Szent -Györgvï 1957). Sometimes all it takes is to look again with a different mindset.
- 10. When you can't control the wind, adjust your sails; change the plan, but never the goal. (inspired by Bertha Calloway 1998).
- 11. Be original and keep evolving, because one's mind stretched to a new idea never goes back to its original dimensions (inspired by Oliver Wendell Holmes, Sr. 1858).
- 12. "Whenever you find yourself on the side of the majority, it is time to pause and reflect." (Mark Twain 1904). No one ever made a difference by being like everybody else.
