(2016), Genomewide meta-analysis identifies loci associated with IGF-I and IGFBP-3 levels with impact on age-related traits. *Aging Cell*, **15**: 811–824. <https://doi.org/10.1111/accel.12490>.

In the article, 'Genomewide meta-analysis identifies loci associated with IGF-I and IGFBP-3 levels with impact on age-related traits', the published Table 1 was incorrect, due to an error. The correct version of the table is shown below:

Table 1 Loci associated with IGF-I and IGFBP-3 concentrations in men and women combined samples at genomewide significance ($P < 5 \times 10^{-8}$) after final stage

Trait	SNP	A1	A2	F1	P	I ²	Chr	Position	Nearest Gene	Gene Distance	Direction effect	
											IGF-I	IGFBP-3

*Known association; '-', coding allele associated with lower IGF-1 and IGFBP-3 levels (indicated by bold italicized text were genomewide significant); "+", coding allele associated with higher IGF-1 and IGFBP-3 levels (indicated by bold italicized text were genomewide significant); Chr, chromosome; A1, coding allele; A2, other allele; F1, frequency of coding allele.

We apologize for the inconvenience caused.
