Curriculum Vitae

Annieck Margo Diks was born on May 13th, 1992 in Doetinchem, the Netherlands. She grew up in Gaanderen. In 2010, she completed her secondary school at the Almende college - Isala, Silvolde. After this, she moved to Wageningen (the Netherlands) and enrolled in the BSc Biotechnology program at Wageningen University & Research Center (WUR). The end of her BSc program comprised a thesis at the Laboratory of Monoclonal Antibodies (LMA, Dep. of Nematology, WUR), where she studied the immunomodulating effect of *Agaricus bisporus* varieties under supervision of dr. Ruud Wilbers and associate prof. Arjen Schots. After completing her BSc studies in 2013, she continued with the master program 'Medical Biotechnology'. During her MSc, she took a gap year in which she volunteered as a full-time board member (chairman position) at the local youth association 'Unitas Wageningen'.

For her MSc thesis, Annieck returned to the Laboratory of Monoclonal Antibodies. Here, she worked on the project 'Transient expression of helminthic protein Sm29 and virus induced gene silencing of β -hexosaminidases in *Nicotiana benthamiana*' under supervision of dr. Ruud Wilbers and associate prof. Arjen Schots. The MSc thesis was followed by an internship at Genmab BV (Utrecht, the Netherlands), where she worked for 6 months in The Antibody Sciences cluster.

Upon completion of her MSc (Oct 2016), Annieck started her PhD trajectory at Leiden University Medical Center (LUMC) in Jan 2017. She worked under supervision of dr. Magdalena A. Berkowska and prof. Jacques J.M. van Dongen. One year into her PhD, Annieck also started working as an external PhD candidate at the Alzheimer Centre (Amsterdam UMC), under supervision of dr. Henne Holstege. The red line of Anniecks PhD project was the monitoring of the human immune system by means of (standardized) flow cytometric analysis of human leukocytes. The results of her PhD are described in this thesis.

In September 2022, Annieck returned to Genmab BV, where she started as Scientist Translational Research.

Acknowledgements

With these words I reach the final part of my PhD thesis. I am grateful to the great people that I've met these past years and for all those people that supported me in one way or another during this journey. With all the opportunities for collaborative studies in which I have been involved, I am pretty sure that this thesis could have been twice as thick, if I would.

My special thanks goes out to:

Jacques, thank you for providing me the opportunity to do my PhD in your group. Not only have you guided me during this process, but you also created extra opportunities to extend my PhD with additional projects.

Magda, you were the best supervisor I could have wished for. Thank you so much for your help, guidance, patience, no-mercy-word reductions in the manuscripts, the occasional pep talks, and of course the fun moments we had in daily life and during conferences.

Rick & Bas, guys, without your help I would probably still be analyzing FCS files. Please know I am eternally grateful for all your support and the fun in the lab.

Cristina, thanks for all your input during these past years. You have helped me a lot with understanding the innate part of the studies, and I truly enjoyed the talks we had during these past years, both the science related and unrelated ones.

Sandra V, thank you for your help with the Centenarian study and the PERIS-COPE studies. Your knowledge, lab skills, and network made experiments easier and more fun.

Indu, thanks for your help with the bioinformatic part of this thesis. I would be completely lost if it weren't for your help.

Gita and Inge, thank you for your help with the Centenarian study. I am not sure how the phagocytosis experiments would have looked without your support and tips about handling of innate cells.

Kyra, Lisanne, and Anniek, it was so nice to be able to share the pros and cons of the PhD trajectory with you. Thank you for those moments.

All other members, students, guest-employees, and veterans of the IMM team: Mihaela, Paula, Bart, Marieke, Nicole, Fenna, Sara, Alita, Sandra B, Alesha, Rosalie, Demi, Jasmina, Laurens, Laura, Safa, Hella, Mirjam, Sandra H, Fadi, Alyssa and Chatelaïne; being part of this team felt natural from the start. When looking back at these past years, my mind fills up with great memories.

Acknowledgements

Hans, Rob, Pauline, Annemarie and Guy: it was simply a pleasure to work with you. Thanks for the nice collaboration and data discussions.

Not to be forgotten are all members of the LUMC Immunology Department, the FCF team, and the PERISCOPE Consortium (especially the Salamanca team). Thank you for your help, feedback, and the fruitful discussions we've had.

Henne, Debbie, Linda, and Susan -actually, everybody on the 100+ team-; Working with you can only be described as a pleasure. I really appreciate the enthusiasm that surrounds the 100+ team members and the great data discussions that we had.

My colleagues from the Hemapheresis Unit/Hematology, especially Jaap Jan, Liesbeth, Linda and Patricia; thank you so much for your efforts for our local pertussis vaccination trial and your professional input. Please know that it was always a pleasure to go upstairs to pick up study samples; your ever-present smiles were a good start of the experiments every time.

Aside from my colleagues, I want to acknowledge my family who supported me during the past 6 years.

Papa & Mary, Mama & Han, Jeroen & Sylvia. Bedankt voor al jullie interesse in dit project de afgelopen jaren, en voor jullie begrip wanneer mijn tijdschema het even niet toeliet was om langs te komen. Bij jullie kom ik thuis.

Kirsten en Relinde, ontzettend bedankt voor alle support de afgelopen jaren.

Patrick, dankjewel. Voor alles. Ik ben benieuwd wat de toekomst ons brengt.
