ACKNOWLEDGMENTS

This thesis would not have been possible without the help, support and guidance of many people.

First and foremost I am extremely grateful to my promoters Prof.dr.ir. J.A.P. Willems van Dijk from Leiden University Medical Center (LUMC) and Prof.dr.ir. W.M.M. Verschuren from the Dutch National Institute for Public Health and the Environment (RIVM), and my co-promotor Dr. M.E.T. Dollé from RIVM for their invaluable supervision, continuous support, motivation and patience during my Ph.D. study. It has been an amazing experience working between these two research institutes with two expert mentors like you. Ko, thank you for your unwavering support and belief in me during all the time of my research and writing of this thesis, but above all, thank you for your emotional support. Monique, thank you for all your valuable insights and suggestions during my Ph.D. Your immense knowledge and experience has greatly shaped my research. Martijn, your enthusiasm and sharp insights offered in our discussions and all the steps of my PhD have greatly helped and encouraged me during this Ph.D. path, and will not be forgotten!

I am also profoundly grateful for the support I was given by two exceptional researchers, Dr. van Klinken and Dr. Noordam, who were always there for me when I needed their help. Jan, it has been a great pleasure to work with you and incorporate your ingenious input in my research. Raymond, thank you for your patience with me even in my stubborn moments, and for guiding me with your excellent skills towards my path as a young researcher.

I would also like to thank my guidance committee members, Dr. Diana van Heemst and Prof. Arn van den Maagdenberg for their constrictive criticism during our follow-up meetings. In addition, a warm gratitude goes to Wenyi and Manon, my Ph.D. colleague and master student, respectively, with whom I shared great conversations on research and beyond. Thank you both for your good hearted nature and positivity during my Ph.D. days. My gratitude extends to the Human Genetics department as a whole, with whom I had the opportunity to share great ideas during our regular research meetings. In particular, I would like to thank the Secretary office of the Human Genetics department, because without their assistance in practical matters beyond research, I would have not been able to have a smooth PhD trajectory.

I would also like to thank my colleagues from two other departments, Endocrinology and Epidemiology departments, where I had the pleasure to present and be part

of insightful research meetings. In particular, I would like to express my gratitude to Prof.dr. Rensen for his inspiring discussions and brilliant input. In addition my gratitude goes to all the participants of the NEO study and those who contributed in setting it up and managing its continuation, in particular I. de Jonge for the data management.

Despite being physically more present at LUMC, the RIVM institute was a big part of my Ph.D. career. I am grateful that my work was part of the great research that this national institute performs, aiming towards good healthcare and a healthy lifestyle. Liset, I would like to thank you for always welcoming me at RIVM and for your input in my research with the Doetinchem cohort. Anneke, I would also like to thank you for continuous support with the data management matters of the Doetinchem cohort. Same thank you as for the NEO study goes to all participants of the Doetinchem cohort and to all of those that have offered their invaluable contribution to this cohort.

Without the trust, support and love of my family and friends, I would not have been able to reach this moment, one of the proudest of my life. My deepest gratitude goes to my source of unconditional love and support: my dear parents and brother: "Thank you for being in my life" I would like to end these acknowledgments by thanking my precious grandmother, who was my main inspiration for my doctoral research.

CURRICULUM VITAE

Dorina Ibi was born in Pogradec, Albania on March 11, 1991. She grew up in Pogradec, where she completed the high school at Muharrem Çollaku in 2009 (*summa cum laude*). In the same year she moved to the United States to follow her Bachelor studies in Biomedical Sciences at Lock Haven University of Pennsylvania, from which she graduated in 2013 with the Highest Academic Achievement Honor and Educational Excellence Award (*summa cum laude*). During her Bachelor years, Dorina did an internship at Dr. Jim Jefferson's lab at Penn State College of Medicine, focusing on the altered gene expression in response to diabetes. After her graduation in May 2013, Dorina started working as a research assistant in Dr. Umut Ozcan's lab at Harvard Medical School, where she had the opportunity to participate in cutting edge research on the relation to drug development for diabetes and obesity. Becoming more challenged to pursue a public health approach to obesity and other related chronic diseases, in Spring 2014, Dorina took an introductory training to Biostatistics and Epidemiology at Harvard Extension School and Boston University School of Medicine.

In 2015 Dorina received the Vrije University Fellowship Programme Scholarship and Holland Scholarship for the Master's Degree in Health Sciences with a specialization in Nutrition and Health at Vrije Universiteit Amsterdam, which she completed in 2016. During her Master's Dorina studied the adherence to the New Dutch Guidelines for a Healthy Diet and Risk of Diabetes in the Dutch Population as part of her internship at EMGO+/VUMC, Institute for Health and Care Research, Amsterdam under the supervision of Dr. Joline Beulens.

Following this research experience, Dorina started her Ph.D. in Genetic Epidemiology at Leiden University Medical Center (LUMC) and National Institute of Public Health (RIVM), supervised by Prof. Dr. Ko Willems van Dijk (LUMC), Prof. Dr. Monique Verschuren (RIVM) and Dr. Martijn Dolle (RIVM). In this thesis titled "Genetics and Life Course Epidemiology of Cardiometabolic Disease", she focused on life course epidemiology and birth cohort analyses of obesity and related cardiometabolic risk factors in the Doetinchem Cohort Study (RIVM) and the genetics of lipid metabolism in the Netherlands Epidemiology of Obesity (NEO) study (LUMC). Dorina completed her doctoral research in 2021, the results of which are described in this thesis. Dorina has presented the results of her research at different national and international congresses among which at the European and International Congress of Obesity (ECO-ICO), European Atherosclerosis Society (EAS), International Genetic Epidemiology Society (IGES) and the Dutch Association for Diabetes Research (NVDO).

At the present, Dorina has extended her research on cardiometabolic disease, focusing on the effects of the urban exposome (non-genetic factors) on type 2 diabetes and cardiovascular disease as a postdoctoral fellow at Utrecht University.
