Printing: Print & Bind

# **Expanding the Coverage of Ecosystem Services in Life Cycle Assessment**

**An interdisciplinary venture**

Proefschrift

ter verkrijging van

de graad van doctor aan de Universiteit Leiden,

op gezag van rector magnificus prof.dr.ir. H. Bijl,

volgens besluit van het college voor promoties

te verdedigen op donderdag 5 oktober 2023

klokke 10:00 uur

door

Elizabeth Migoni Alejandre

geboren te Tijuana, Baja California, Mexico

in 1991

**Promotores:**

Prof. dr. ir. P.M. van Bodegom

Prof. dr. ir. J.B. Guinée

**Promotiecommissie:**

Prof. dr. ing. M.G. Vijver

Prof. dr. E.G.M. Kleijn

Prof. dr. ir. A. van Timmeren (TU Delft)

Dr. L.A. Scherer

Dr. R. Heijungs (VU Amsterdam)

This work was supported by the National Council for Science and Technology of Mexico (CONACYT) under grant number 604653.

# Preface

At the beginning of every PhD journey, there are several questions awaiting to be answered. There are those questions mold by the researcher in training, the PhD candidate along with their supervisors and team, and, in other instances, questions that arise at different stages of development in the life of a researcher. The origins of the questions we tackle, are all rooted in a desire to understand the reality that surrounds us, an attempt to explain it, or at least, to envision a way in which we can actively describe and influence the elaborated mantelpiece of facts and conjectures we witness while doing science. In my case, the questions that led to the start of this journey to become a trained researcher on environmental sciences, came in the middle of the Caribbean Sea, while volunteering in an oceanographic research cruise where physicists and oceanographers had begun modelling underwater currents to help provide information on the possible extent of the disastrous Deepwater Horizon oil spillage, where an estimated amount of 780,000 m<sup>3</sup> of crude oil leaked to the sea.

By the time I enrolled as volunteer for this research cruise, I had been majoring in Biology. My specialization track had been biomedicine, and while training at the immunology lab, the amount of time I was spending looking through microscope and tubes had become larger than the time I had spent looking out the window. Despite the unhealthy sleeping and eating habits of most of those who work full time in a biology lab, I was satisfied with the job I was doing, studying the different mechanisms the body uses to heal itself, and the ways we can engineer molecular and cellular systems to help us in the fight against yet unconquerable diseases. Working in biological labs involves not only training on specialized techniques, but also on safety procedures and guidelines. One night staying until late at the lab waiting for a sample, I started wandering around the isles, looking at the labels on all the different bottles and containers we regularly used. The black and red labels, all indicating different effects and risks associated with the substances inside, carcinogenic, mutagenic, toxic. It is not only important to know how to handle these substances, but it is of even higher importance to know how to dispose of them in a safe manner. The questions arose in my mind after contemplating at these labels: *What happens to all this waste, where does it end if disposed carelessly?* Skepticism or simple realism, but it

was hard for me to believe that all these heavily toxic and pollutant materials were correctly dealt with in my country, let alone all around the world. How much work in the lab trying to cure a disease could compensate for all the unintended consequences of the instruments we use and their collateral damage? The question remained unconsciously in a corner of my mind. As a stone in the shoe, I kept walking without putting too much thought on it. After all, I was focused on another task, one that I could address with the tools and studies I had chosen.

The vacancy for a paid volunteer job in an oceanographic cruise came as gift of destiny, through people I knew and at a time when both the experience and money were highly welcomed. That summer, I bought hard shell boots and packed my bags to spend more than 4 weeks ashore cruising on a research boat, helping with the small tasks onboard and cleaning measuring instruments that were extracted back from the ocean for maintenance and collection of data. Spending weeks out in the ocean has been one of the most fascinating experiences of my life, not only for the opportunity of seeing the Caribbean Sea blur its horizon line with a red scarlet sky, but also for the opportunity of being confronted once again with a question that had come to me before, and to which I had, partly, closed the door due to lack of experience and, I must admit, courage.

The Deepwater Horizon oil spillage was one of the largest documented disasters of recent times. Millions of gallons drained out of wells, thousands of animals washed ashore covered in black sludge. By the time of the spill, the only information that could help determine how far the spill could go and which potential routes it would take, were the studies from an oceanographic research group from Baja California that had been developing a numerical model to describe underwater currents in the Caribbean Sea. With an ecological disaster at hands, the funding for this research group increased to aid the strategies that would be put in place to attempt remediation and future prevention. The intersection of oceanographers, physicists, and many other disciplines involved in the project, were a first glimpse for me on the importance of interdisciplinary collaboration, and it woke up a question that was closely related with that old stone in my shoe: What if we could prevent, or at least attempt to foresee, with the same amount of strength in collaboration, the unintended consequences of our practices, and the risks to which we submit ourselves, and our surroundings?

*To my mother, Amelia.*

# Table of Contents

1. General Introduction .....	1
1.1 The unknown unknowns .....	1
1.2 The Ecosystem Service approach .....	2
1.3 Life Cycle Assessment .....	5
1.3.1 Brief overview of the framework .....	6
1.3.2 Characterization factors, what are they?.....	9
1.4 Assessing ecosystem service impacts in LCA .....	11
1.5 Problem identification .....	13
1.6 Research objectives of the thesis .....	14
1.7 Outline of the thesis.....	14
References .....	17
2. Towards an Optimal Coverage of Ecosystem Services in LCA .....	27
2.1 Introduction .....	29
2.2 Methods.....	32
2.2.1 Selection of ES terminology and classification system.....	33
2.2.2 Selection of the LCIA method .....	34
2.2.3 Prioritization of ES .....	35
2.3 Results .....	35
2.3.1 Current coverage of ES in LCA.....	35
2.3.2 An optimal coverage of ES .....	40
2.3.3 Prioritizing ES for incorporation in LCAs .....	43
2.4 Discussion.....	45
2.4.1 Robustness of the optimal state .....	45
2.4.2 Prioritization results and robustness.....	46
2.4.3 Aggregation of the optimal coverage.....	48
2.4.4 Implementation of future indicators .....	49
2.5 Conclusion.....	50
2.6 Supporting information .....	50
References .....	51

3. Characterization model approach for LCA to estimate land use impacts on pollinator abundance and illustrative characterization factors.....	57
3.1 Introduction .....	59
3.2 Methods.....	61
3.2.1 Selection of a midpoint impact category .....	61
3.2.2 Impact models in the literature targeting pollinator abundance .....	64
3.2.3 Characterizing pollinator abundance .....	67
3.3 Results.....	68
3.3.1 Impact model selected from the literature.....	68
3.3.2 Alternative approach .....	70
3.3.3 Application for LCA .....	71
3.4 Discussion.....	76
3.4.1 Scientific and methodological advances.....	76
3.4.2 Limitations and potential improvements.....	78
3.4.3 Outlook.....	79
3.5 Conclusions.....	81
3.6 Supporting information .....	81
References .....	82
4. Characterization Factors to Assess Land Use Impacts on Pollinator Abundance in Life Cycle Assessment.....	89
4.1 Introduction .....	91
4.2 Methods.....	92
4.2.1 Characterization model for land use impacts on pollinator abundance .....	92
4.2.2 Deriving pollinator abundance estimates ( $Sx$ ).....	93
4.2.3 Selection of land use types to characterize.....	95
4.2.4 Delphi assessment procedure.....	96
4.2.5 Statistical processing of Delphi assessment results .....	97
4.3 Results.....	98
4.3. 1 Pollinator abundance estimates.....	98
4.3.2 Generic characterization factors for potential land use impacts on pollinator abundance .....	100
4.4 Discussion.....	103

4.4.1 Considerations of expert elicitation assessment to characterize pollinator abundance .....	103
4.4.2 Dealing with uncertainty.....	104
4.4.3 Application in LCA and recommendations .....	105
4.5 Conclusion.....	107
4.6 Supporting information .....	107
References .....	108
5. Assessing the use of land system archetypes to increase regional variability representation in country-specific characterization factors: a soil erosion case study	115
5.1 Introduction .....	117
5.2 Methods.....	118
5.2.1 Land system archetypes .....	118
5.2.2 Determination of land use-specific characterization factors .....	120
5.2.3 Producing country specific characterization factors.....	122
5.2.4 The indicator result.....	123
5.3 Results .....	124
5.3.1 Land use-specific characterization factors .....	124
5.3.2 Country-specific characterization factors.....	126
5.4 Discussion.....	131
5.4.1 Considerations for country-specific characterization factors .....	131
5.4.2 Advantages of land system archetypes .....	132
5.4.3 General recommendations for LCA application .....	132
5.5 Conclusions.....	134
5.6 Supporting information .....	134
References .....	135
6. General Discussion.....	141
6.1 Bridging the gap.....	142
6.1.1 Ecosystem services in LCA: where are we now? .....	142
6.1.2 Proposing a new impact category: Land use impacts on wild pollinator abundance .....	145
6.1.3 Deriving readily applicable characterization factors and the importance of interdisciplinary research .....	148

6.1.4 Addressing regionalization and intranational variation in country-specific characterization factors .....	150
6.2 Limitations and outlook .....	153
6.2.1 The issue of land use and land transformation .....	153
6.2.2 Societal relevance .....	155
6.3 Conclusion .....	157
References .....	158
Abbreviations .....	165
List of symbols .....	166
Summary .....	167
Samenvatting .....	170
Acknowledgements .....	173
List of publications .....	174
Curriculum Vitae .....	175
