Acknowledgements

Time flies! I have been working and living in Leiden for four years before I knew it. There are many unforgettable memories and nice people that I will keep in my mind and treasure for a lifetime.

Firstly, I would like to express my immense gratitude to my promotor Prof. Dr. B. Ewa Snaar-Jagalska. I still remember the first time we met in your office. You introduced me to our zebrafish community and the new research world of melanoma. You showed me how to tell a scientific story step by step. I am deeply impressed by your great passion to science, your intelligent thinking, serious scientific attitude, and sincere kindness. I am very touched every time you share travel photos with me and tell me interesting stories. You always provide me with great help and kind support in my PhD life, especially when I was in hard times. I am glad I have spent a wonderful adventure of academic and personal growth in your group during the past four years. And for that, I extend my heartfelt appreciation to you.

To my second promotor, Prof. Dr. Martine J. Jager, I am truly grateful for your fine feedback and assistance with my writing. Your profound knowledge of ocular melanoma greatly improved the quality of the thesis. I appreciate your friendly guidance. I would also like to show my genuine gratitude to my co-promotor, Dr. Mei Wang. You introduced me to this magic land to study abroad. Your support consistently encouraged me to overcome difficulties in the new environment.

To my dear senior colleagues, Arwin and Gabriel. I am grateful I could work together with you. Arwin, thanks for your experiment training and introduction when I came to the lab. You led me into a new world of zebrafish research. Gabriel, thanks for sparing no effort to assist with my thesis. I deeply admire your professional ability and rigorous scientific research attitude. Thanks to my best comrade, Gangyin Zhao, we always support and encourage each other in the pathway of research. Even though our values are so different, we can still have a deep and wonderful discussion. Thanks, Jiajun Xie. You are the gentlest person I have ever seen. Your kindness and patience will empower me a lot throughout my whole life.

I would like to acknowledge PIs and colleagues for all their help and support. Thanks to Prof. Dr. Annemarie, Dr. Marcel, Prof. Dr. Herman, Dr. Coert, and Prof. Dr. Roeland for valuable questions during meetings, knowledge sharing, and assistance with my research. Thanks to Saskia and Alex for organizing all the issues in the lab. Thanks to caretakers Guus and Ulrike, for always being responsible and taking excellent care of our lovely fish. Thanks to Natasha, you have a punky outlook and a soft heart. I will never forget the warm hug you gave me. Thanks to Gerda and Joost for sharing knowledge about microscopy and image analysis. Thanks to Mahmoud,

Wanda, and Qin Su for the generous help with my projects. You always provide me with good scientific inspirations and timely technical support.

I would like to thank my paranymphs, Simon and Akshaya. Simon, I believe you will make great strides in scientific research with your intelligence and diligence. Akshaya, you are my first master student. We spent a lot of fun time in the lab even if we were both shy at the beginning. I also want to acknowledge my lovely zebrafish group colleagues, Saloni, Patrick, Erin, Monica, Salome, Wendy, Vincent, David, Tessa, Robin, and others. Thanks for your help during daily experimental work. I would express my gratitude to Lanpeng Chen, Quanchi Chen, Wanbin Hu, Yi Ding, Junling He, Zhan Xiong, Li Liu, and Bei Chen. Without your care and support, I would not be able to complete this research.

To my dear friend, Ying Chen, thanks for accompanying me through the most difficult times. To Yanan Liang, Chao Li, Xiangyu Liu, Jia Li, Qian Huang, Meiru Wang, Shixiong Chen, Dongdong Bi, Zili Gu, Qihui Liang, Rama, and Stella, I appreciate the wonderful time we spent together. You provided me with much happiness during my life in Leiden.

I would express my appreciation to my parents, your unwavering support is my greatest foundation. Mom, I love you with all that I am forever. Thanks my boyfriend Zihao, you made me realize the strength and beauty of love. To my little niece, your smile has the power to heal all my pains and weariness. To my brother and sister-in-law, thanks for your support and we will stand by each other through our whole lifetime.

Last but not least, thanks to the China Scholarship Council for the financial support of my PhD research at Leiden University. I would like to thank all the people who kindly helped me during my PhD journey. Bless you all.

Curriculum Vitae

Jie Yin was born on 11th November 1993 in Shanxi Province, China. In September 2012, she started her bachelor's study in Traditional Chinese Medicine at Capital Medical University, China. She obtained her bachelor's degree in June 2016. From September 2016, Jie started her master's study in Pharmacology and was jointly trained by the Institute of Chinese Materia Medica and Capital Medical University, China. During her master's internship, under the supervision of Prof. Dr. Xiaoxin Zhu and Dr. Qi Li, she investigated the effect and mechanism of Shenlian extract on inflammatory resolution in atherosclerosis mice models. She obtained her master's degree in June 2019. In September 2019, Jie came to the Netherlands to pursue further academic training as a Ph.D. candidate, which was supported by the Chinese Scholarship Council. She started her studies at the Institute of Biology of Leiden University under the supervision of Prof. Dr. B. Ewa Snaar-Jagalska, Prof. Dr. Martine J. Jager, and Dr Mei Wang. During her PhD research, she focused on establishing the ocular melanoma zebrafish xenograft model. Based on this model, she uncovered the role of lactate secreted by glycolytic conjunctival melanoma cells in attracting macrophages to drive angiogenesis. Besides, she identified that the antitumor effect of glycosylated PPD-ginsenosides on conjunctival melanoma relies the Glucosylceramidase beta 2 (GBA2) activity from microenvironment.
