ACKNOWLEDGEMENTS

The past four years during which this book was completed have been transformative, both on a scientific and personal level, for which I want to thank many people. First of all, I thank my supervisor Martin van Exter. His enthusiasm for the experiment and extensive knowledge have been a great motivation during my PhD. I always enjoyed the open discussions about a broad range of topics, during which he showed that with an intuitive understanding and a few “simple” formulas one can describe almost everything. It has also been a pleasure to work with Chunjiang He. I wish him much success and fun in continuing our research and finding much more interesting physics!

I like to thank all members of the Quantum Optics group in Leiden, Wolfgang Loeffler, Michiel de Dood, Michel Orrit, Dirk Bouwmeester, Henriette van Leeuwen, Matteo Fiscaro, Xingchen Chen, Kirsten Kannevorf, Xinrui Wei, Leon Raabe, Felix Smits, Erik Baalbergen, Mio Poortvliet, Jacobo Paintanida, Thomas Steenbergen and many bachelor and master students I have met along the way. I particularly like to thank Petr Steindl for the many discussions about specific lab problems or the more general questions in physics. I want to thank Jacco Ton for the help with chemistry and sample fabrication.

I want to thank the technical support staff from the FMD and ELD. In particular Robin Schrama from the FMD for designing and making the full setup and Arno van Amersfoort for making and programming the control of the Hexapod system. I think the high quality of these departments is unique and part of the reason for the great research done in Leiden.

I thank Aurelian Trichet and Jason Smith from Oxford HighQ (UK) for providing the micromirrors.

I thank Moritz Fischer and Nicolas Stenger from the DTU in Copenhagen, who provided us with the hBN samples and with whom we had nice discussions on the hBN flakes.

I thank Martijn Wubs from DTU and Pepijn Pinkse from the University of Twente for the useful discussion about the fine structure in optical cavities.

I like to thank all the students who helped our research progress. Thomas Osterholt, for starting up the project and getting the hexapod to work. Matt van den Nieuwenhuijzen, for setting up the confocal microscope with a very helpful graphical user interface. Sean van der Meer, Martin Bijl, and Erik Baalbergen for measuring and analyzing large amounts of data to fully understand the fine structure. Nelli Gnezdovskaia, Aayush Desai, and Thomas Steenbergen for finding the single-photon emitters in hBN.

I like to specially thank Xingchen Chen. She has been a great support when we both struggled in the labs and during the lockdowns. It has always been fun to talk about modes and peaks in the data, and I also learned a lot from her about the black magic of sample fabrication.

Furthermore, I like to thank all the others whom I met at some point in the measurement hall or some other place at the university for nice conversations.

Last I like to thank all my friends and family without whom this thesis would not be possible!

CURRICULUM VITÆ

Corné Koks

19-07-1996 Born in Oosterhout, Netherlands.

EDUCATION

2014–2017 BSc. Applied Physics
Technische Universiteit Eindhoven

2017–2019 MSc. Physics
Universiteit Leiden

2019-2023 PhD. Physics
Universiteit Leiden
