Withstanding the cold

Energy feedback in simulations of galaxies that include
a cold interstellar medium

Proefschrift

ter verkrijging van
de graad van doctor aan de Universiteit Leiden,
op gezag van rector magnificus prof.dr.ir. H. Bijl,
volgens besluit van het college voor promoties
te verdedigen op dinsdag 27 februari 2024
klokke 11:15 uur

door

Evgenii Chaikin

geboren te Kaliningrad, Rusland
in 1995

Promotor:

Prof.dr. J. Schaye

Co-promotor:

Dr. M. Schaller

Promotiecommissie:

Prof.dr. R.A. Crain (Liverpool John Moores University)

Prof.dr. J.F. Hennawi

Prof.dr. M.T. Kriek

Dr. S. Ploeckinger (University of Vienna)

Prof.dr. S.F. Portegies Zwart

Prof.dr. I.A.G. Snellen

ISBN: 978-94-6496-025-9

Cover by the author. Shown are AGN-driven outflows in cosmological hydrodynamical simulations of galaxy formation with the COLIBRE galaxy formation model. The outflow images were created using SWIFTSIMIO and edited in Adobe Photoshop 25.1.0.

BiD4BES^t has received funding from the European Union's Horizon 2020 research and innovation programme under the Marie Skłodowska-Curie grant agreement No 860744.

Contents

1	Introduction	1
1.1	Cosmological background	1
1.1.1	The Λ CDM model	3
1.1.2	Density perturbations and their growth in time	5
1.2	Baryons and galaxies	7
1.2.1	First galaxies	8
1.2.2	Basics of stellar nucleosynthesis	9
1.2.3	Stellar feedback and metal enrichment	10
1.2.4	Core-collapse supernovae	12
1.2.5	Type-Ia supernovae	14
1.2.6	Black holes	15
1.2.7	Active galactic nuclei	16
1.3	Numerical simulations of galaxy formation	17
1.3.1	Motivation	17
1.3.2	Resolution and volume requirements	19
1.3.3	Simulating dark matter using gravity solvers	20
1.3.4	Simulating baryons using smoothed particle hydrodynamics	23
1.4	Subgrid physics in simulations of galaxy formation	27
1.4.1	Simulating radiative cooling and heating processes	28
1.4.2	Simulating star formation	30
1.4.3	Simulating stellar mass loss	32
1.4.4	Simulating energy feedback from core-collapse supernovae	33
1.4.5	Simulating other forms of feedback from stars	34
1.4.6	Seeding of supermassive black holes in galaxy simulations	35
1.4.7	Simulating mass growth of supermassive black holes	35
1.4.8	Simulating AGN feedback	37
1.5	Simulations of galaxy formation. Current status and future steps	39
1.5.1	Comparisons between simulated galaxies and observational data	41
1.5.2	Challenges in numerical galaxy formation	43
1.6	This thesis	44
	References	47

2 Simulations of ^{60}Fe entrained in ejecta from a near-Earth supernova: effects of observer motion	51
2.1 Introduction	52
2.2 Methods	55
2.2.1 Simulation setup	55
2.2.2 Heating and cooling	56
2.2.3 Analytical solution	57
2.2.4 Accuracy test. Runs with and without cooling	59
2.2.5 Ejecta tracing and diffusion	60
2.2.6 Blastwave properties	62
2.3 Simulation results	66
2.3.1 Well-mixed ejecta	66
2.3.2 Ejecta as predicted by the simulation	69
2.3.3 Peak complexity and agreement with data	73
2.4 Discussion	75
2.4.1 Major differences with the well-mixed scenario and ram pressure	75
2.4.2 Comparison with previous work	76
2.4.3 Caveats and limitations	77
2.5 Conclusions	78
References	82
Appendix	84
2.A Resolution tests	84
2.B Uncertainties in distribution of ejecta	84
2.B.1 Effect of diffusion constant	84
2.B.2 Impact of initial distribution of ejecta	86
3 The importance of the way in which supernova energy is distributed around young stellar populations in simulations of galaxies	91
3.1 Introduction	92
3.2 Neighbour selection	95
3.2.1 Mass-weighted method	95
3.2.2 Isotropic method	95
3.2.3 Minimum distance method	96
3.2.4 Minimum and maximum density methods	98
3.3 Numerical simulations	98
3.3.1 Code and setup	98
3.3.2 Initial conditions	99
3.3.3 Subgrid model for galaxy evolution	101
3.3.4 Runs	105
3.4 Results	106
3.4.1 Isolated galaxy simulations	106

3.4.2	Cosmological simulations	117
3.5	Discussion	119
3.5.1	Comparison with previous work	119
3.5.2	Extension to other hydro solvers than SPH	121
3.5.3	Extension to other subgrid feedback models	121
3.6	Conclusions	122
