1. Literature review references

In the literature a range of features of ‘responsible sourcing’ were identified. These features refer to sustainability characteristics or to the scope of ‘sourcing’ in the supply chain. Table A1 provides an overview of these features as found in the literature review.

Type	Features linked to ‘responsible sourcing’	Example references
Socially responsible sourcing	"social" (aspects, considerations)	Seong-Jong Hoo et al. (2010), Brown (2009), Young (2015), Zorzini et al. (2015)
	"human rights" (abuse)	Buhmann (2017), Simmons (2014), Faber et al. (2017)
	"conflict minerals" (armed groups)	Simmons (2014), Young (2015), Partzsch and Vlaskamp (2016), RSN (2011)
	"working conditions" (health, safety)	Brown (2009), Idle (2009), Henkle (2005) (Faber et al. 2017)
	"forced labour"	RSN (2011)
	"child labour"	Faber et al. (2017)
Sustainable sourcing	"social" + "environmental"	Upstill-Goddard et al. (2016), Wassel (2010), Guo et al. (2016) Caveen et al. (2017), Ghumra et al. (2011)
	"sustainable" or "social + economic + environmental"	Upstill-Goddard et al. (2015), Upstill-Goddard et al. (2012), Glass (2011), Young and Osmani (2013), Nickless (2018), Ali et al (2017), Govindan et al. (2015), Dainty et al. (2011), Murthy (2013), Glass et al. (2012), Gandhi et al. (2011), Howells (2011), Oliver (2007).
	"environmental" practices/ impact/protection	Ali et al. (2017), Wall et al. (2017), Dainty et al. (2011)
	"workforce health and safety"/ "working conditions" "child labour"	Wall et al. (2017), Dainty et al. (2011)
	"community interaction"	Wall et al. (2017)
	"energy use, carbon footprint, water use, resource efficiency, and resource and reserve reporting, climate change"	Wall et al. (2017), Ali et al. (2017)
	"corruption, transparency in economic contributions (such as taxes)"	Dainty et al. (2011), Wall et al. (2017),
Scope		
Scope a: Upstream	"upstream management"	Zorzini et al. (2015)
	"farmers", "fishing"	Seong-Jong Hoo et al. (2010), Shepherd et al. (2017), Caveen et al. (2017)
	"OECD due diligence/ conflict minerals"	Buhmann (2017), Simmons (2014)
	"source (origin) and production of raw material"	Young (2015)
	"mineral exploration and sustainability of mining and ore processing, mining"	Nickless (2018), Partzsch and Vlaskamp (2016), Faber et al. (2017)
Scope b: Entire supply chain	"material and product supply chains/ sourcing supply chain (BRE certification) "	Glass et al. (2011), Upstill-Goddard et al. (2012), Upstill-Goddard et al. (2015), Ghumra et al. (2011), Howells (2011), Brankley (2011), Glass (2011), Spencer and Clarke (2009), Oliver (2007)
	"mined, extracted, and manufactured"	Murthy (2013)
	"throughout the (product) supply chain"	Glass et al. (2012)

Table A1. Features associated with ‘responsible sourcing’

In the article it was concluded that the term ‘responsible sourcing’ can be considered an umbrella term for socially responsible sourcing, green sourcing and, broadest of all, sustainable sourcing. In terms of the supply chain, it can refer to management of the upstream part only or to the entire chain. An analysis was made (Figure A1) of how often these features of ‘responsible sourcing’ were identified in the literature on responsible sourcing of minerals and in the literature on responsible sourcing in other sectors.

Figure A1: Analysis of the ‘features’ of ‘responsible sourcing’ as identified in the literature

1. Trade flow inconsistencies

This section provides additional information about the trade flow analysis in section 3.3. Sun et al. (2019) made a similar map of the cobalt trade. The map of cobalt trade (based on 2015) from the study by Sun et al. (2019) shows flows of cobalt ores and concentrates between the Democratic Republic of the Congo and Finland, and Belgium. Their study is based on export data, but they noted that export trade flows of Democratic Republic of the Congo were not reported in the Trade Database, and that the trade amount from the Democratic Republic of the Congo was estimated by corresponding trade of other countries (Sun et al., 2019).

In our study, based on import data, we did find export flows from the Democratic Republic of Congo, but not between the Democratic Republic of the Congo and Belgium and Finland, therefore these are not shown in Figure 3.1. The BGS (2018) notes that the cobalt recorded as refined in Belgium is actually refined in China, which would explain the lack of flows between Belgium and the Democratic Republic of the Congo. An explanation for the lack of flows to Finland could be that the import of these countries is reported under a commodity code that is not specifically for cobalt, e.g. under nickel or copper products. The latter would also explain the export flows missing from Indonesia, Vietnam and the Philippines, these countries mine cobalt, do not have a refinery and export little to no cobalt.

2. HS codes of cobalt trade flows

HS code	Description
2605	Cobalt ores and concentrates
2822	Cobalt Oxides and hydroxides: commercial cobalt oxides
8105	Cobalt: mattes and other intermediate products of cobalt metallurgy, cobalt and articles thereof, including waste and scrap
282734	Chlorides: of cobalt
291523	Acids: saturated acyclic monocarboxylic acids: cobalt acetates: no results import of export data

Table B1. HS codes of cobalt trade flows (Comtrade, 2019)

3. Estimated percentage cobalt content in intermediate cobalt products

Cobalt 'product'	HS code	Estimated percentage cobalt	Source
Cobalt ores	2605	0.1% to 2.5% depending on the deposit	British Geological Survey (2009). Cobalt. https://www.bgs.ac.uk/downloads/start.cfm?id=1400 (accessed 16 April 2019)
Cobalt concentrates	2605	Up to 15%	Young, R.S., Campbell Taylor, J. (2017) Cobalt processing. https://www.britannica.com/technology/cobalt-processing (accessed 16 April 2019)
Cobalt oxides	2822	Around 79% (depending on form)	Wikipedia (2019). Cobalt (II) oxide. https://en.wikipedia.org/wiki/Cobalt(II)_oxide (accessed 16 April 2019)
Cobalt hydroxide	2822	Around 54% (depending on form)	Wikipedia (2019). Cobalt (II) hydroxide. https://en.wikipedia.org/wiki/Cobalt(II)_hydroxide
Unwrought cobalt	8105	For example, an ingot of unwrought cobalt alloy is made up of 68% cobalt. Bare hardfacing welding rods typically contain 60% of cobalt. Electric induction melted 64%.	Tariff Nomenclature (2016). Other cobalt, unwrought, powders. https://tariff.cc/en/other-cobalt-unwrought-powders (accessed 16 April 2019)
Powders	8105	Commercial cobalt-metal powders are available in purities ranging from 99% to ≥ 99.999% in many grades, particle size ranges and forms.	International Agency for Research on Cancer. (2018). Metallic cobalt particles (with or without tungsten carbide). https://monographs.iarc.fr/wp-content/uploads/2018/06/mono86-6.pdf (accessed 16 April 2019)
Cobalt matte	8105	Cobalt content in matte is around 1.5% to 2%.	British Geological Survey (2009). Cobalt. https://www.bgs.ac.uk/downloads/start.cfm?id=1400 (accessed 16 April 2019)

Table B2: Estimated percentage cobalt content in cobalt products.

*The cobalt content of cobalt ores can range from 0.1% to 2.5% depending on the deposit (BGS, 2009), while cobalt concentrates can contain up to 15% of cobalt content (Young, Campbell and Taylor, 2017). Cobalt mattes can contain 1.5% cobalt (BGS, 2009), while cobalt powders can contain 99.9% cobalt (International Agency for Research on Cancer, 2018).

4. Mined and refined cobalt production (metal content) in kiloton (kt) in 2016

Country	Mined cobalt production 2016 (kt)*	Refined cobalt production 2016 (kt)**
Democratic Republic of the Congo	69	0
China	11	45
Canada	7	6
Australia	6	3
Zambia	5	5
New Caledonia	4	3
Cuba	4	0
Brazil	4	0
Madagascar	3	3
Philippines	3	0
Finland	2	12
Papua New Guinea	2	0
Russia	2	2
Morocco	2	2
Poland	2	0
South Africa	1	1
United States	1	0
Zimbabwe	0	0
Indonesia	0	0
Botswana	0	0
Vietnam	0	0
Belgium		6
Japan		4
Norway		4
France		0
India		0
Total	128	98

Table B3. Mined and refined cobalt production (metal content) in kiloton (kt) in 2016 (BGS, 2018)

*Mined cobalt production: the production for the United States, Brazil, China and Indonesia are not provided by the countries but based on estimations by the BGS. For Russia, Morocco, South Africa, Zambia and Zimbabwe the cobalt is either metal and/or refined.

**Refined cobalt production: refined cobalt can be in the form of metal, oxides, carbonates, sulfates and many other compounds, efforts are made to avoid double-counting, but it is not always possible to be certain (BGS, 2018)

5. Cobalt mines, by-products, production 2016, mine operators and shareholders

6. World Governance Index

	Political Stability and Absence of Violence/Terrorism	Mined cobalt production 2016 (BGS 2018)	Refined cobalt production 2016 (BGS 2018)
Congo, Dem. Rep.	-2,23	68822	400
Philippines	-1,38	2554	
Russian Federation	-0,95	2100	2100
Zimbabwe	-0,62	409	
China	-0,5	10500	45046
Papua New Guinea	-0,5	2191	
Brazil	-0,38	3600	400
Indonesia	-0,37	350	
Morocco	-0,31	2081	2081
Madagascar	-0,29	3370	3273
South Africa	-0,14	1101	1101
Zambia	0,14	4725	4725
Vietnam	0,23	134	
United States	0,4	690	
Poland	0,51	1670	
Cuba	0,69	3694	
Botswana	0,99	248	
Finland	1	2308	12393
Australia	1,05	6012	3200
Canada	1,26	6969	6355
Belgium	0,44		6329
Japan	0,98		4305
Norway	1,2		3541
France	-0,1		119
India	-0,95		100
Total negative WGI score		-7,76	-5,85
Total Positive WGI score		6,27	6,07

Table B5: World Governance Index – PV weighted to cobalt mined and refined production. World Governance Index (2019).

7. Environmental Performance Indicator

Country	Environmental Performance Indicator (2016)	Mined country production (t) (BGS, 2018)	Refined production (t) (BGS, 2018)
Australia	87	6012	3200
Botswana	71	248	
Brazil*	79	3600	400
Canada	85	6969	6355
China*	65	10500	45046
Cuba	79	3694	
DRC	42	68822	400
Finland	91	2308	12393
Indonesia*	66	350	
Madagascar	37	3370	3273
Morocco	74	2081	2081
New Caledonia			2531
Papua New Guinea	48	2191	
Philippines	74	2554	
Poland	81	1670	
Russia	84	2100	2100
South Africa	71	1101	1101
United States	85	690	
Vietnam	59	134	
Zambia	66	4725	4725
Zimbabwe	59	409	
Belgium	80		6329
France	88		119
India	54		100
Japan	81		4305
Norway	87		3541
Total Production		123528	97999
Weighted EPI		56	71

Table B6: Environmental Performance Indicator weighted to cobalt mined and refined production (based on Hsu, A. et al., 2016).)

8. Most important current nickel-cobalt primary production routes

Figure B1. Most important current nickel primary production routes, intermediate products, nickel content and applications.

Source: Schmidt, T., Buchert, M., Schebek, L. Investigation of the primary production routes of nickel and cobalt products used for Li-ion batteries. Resources, Conservation and Recycling, 112, 107–122. <http://dx.doi.org/10.1016/j.resconrec.2016.04.017>

Examples of leaching/smeltering on site:

- At the Moa Bay mine there is the Moa Bay nickel smelter “Moa uses an open-pit mining process to mine lateritic ore, which is processed using high-pressure acid leaching on-site into mixed sulphides containing nickel and cobalt”. (Sherritt, 2019, <https://www.sherritt.com/English/operations/metals/Moa/default.aspx>, accessed August 2019)
- At the Rio Tuba Nickel mine in the Philippines, Coral Bay Nickel Corporation operates a Hydrometallurgical Processing Plant (HPP) to produce nickel and cobalt sulfide from existing stockpiles of low grade nickel ores from the Rio Tuba nickel mine (Coral Bay Nickel, 2019, <http://coralbaynickel.com/>, accessed August 2019)
- At the Nchanga mine in Zambia, Konkola copper mines operates the Konkola smelter (Konkola Copper Mines, <http://kcm.co.zm/our-operations/mining-process/>, accessed August 2019)
- At the ruashi mine in the Democratic Republic of the Congo Meteorex operates a modern solvent extraction electro-winning plants (Meteorex, 2019, <http://www.meteorexgroup.com/mine/ruashi-mining/>, accessed August 2019)

9. Map of the Central African Copper Belt giving an overview of DRC's industrial and artisanal copper cobalt mines

Figure B2: Map of the Central African Copper Belt giving an overview of DRC's industrial and artisanal copper cobalt mines as well as refineries and smelters (BGR 2017b)

1. Balancing price feedback loops

Supply chain disruptions lead to a (perceived) lack of supply or increase in demand. This will result in a price increase that can incentivize investments in new production (balancing feedback loop B1), recycling (balancing feedback loop B3), research on substitution / improving material properties (balancing feedback loop B5) or to emergency stockpiling (balancing feedback loop B5). Investments in new production (B1) increase the ore supply, after a significant time delay (Sprecher et al., 2015). This time delay depends on the type of new production. According to Van de Camp (2018) the development of a new mine can take 7 to 10 years, while reopening a mine that is in care and maintenance, or expanding a mine has a time lag of 1.5 to 3 years. There can also be instantaneous new production by an increase in recovery rates from the host's production process, or to extract it from the host metals tailings.

Figure C1. Summary of the main balancing price feedback loops.

These are also illustrated in Figure 1 in the article. The red rectangles represent supply and demand disruptions or threats of supply or demand disruptions. The blue arrow represent the balancing feedback loops, linked to balancing feedback loops 1 to 5. The green rectangles represent the resilience mechanisms.

2. Top 10 largest antimony producers between 1929 and 2018

Figure C2. Top 10 largest antimony producers between 1929 and 2018 (production in metric tonnes).

Data from 1932 until 1993 is from the USGS archive. Of note: the data differs per publication, often it is adjusted in later years, data from earlier years is used and sometimes it is an estimate (USGS, 2021).

3. HHI antimony mine production country level 1929-2018

Figure C3. The HHI of global antimony production by country from 1929 to 2018 (USGS, 2021). Above the green line (1500-2500), the supply is moderately concentrated, above the red line (HHI>2500), the supply is highly concentrated.

4. Price-production correlation for price cycles

Figure C4. Price-production correlation from 1913-2020 of price cycles.

Price cycles are from the lowest price point to the lowest price point based on the global antimony production and price (Argusmedia, 2021, US Antimony, 2020, USGS, 2011, USGS, 2012, USGS, 2017b).

Table C1: Overview of individual antimony mines, operators and the estimated production in 2018 and made-up abbreviations for Figure C6.

Notes

a) Multiple, possibly including Yunnan Muli Sb, Huachang Mining Limited, Shenyang Huachang Non-Ferrous Mining Co., Ltd, Shenyang Five Star Mining Co., Ltd, Guangzhou Antimony Star Mining Co., Ltd and Hunan Changde Mining Corporation.

(1): Reported production year other than 2018 (2015, 2016, 2017, 2019, 2020)

(2): only the capacity is known, not the production: China and Bolivia, ratio capacity to reported overall production:

China: only the capacity of the refined production of Sb in 2016 was identified. Most companies are integrated and have mining and refining/smelting facilities. For some companies' mines were found, but for most only the refined production, this Sb is likely originating from multiple mines. According to Research in China (2016) there are roughly 71 Sb producers in China, of which 5 companies together contribute more than 80% of the country's total production. The total production in 2018 in China was estimated at 89600 tonnes. Assuming the production ratio per company remained similar since 2016, 80%, or 71600 tonnes is estimated to be produced by the five companies. The remaining 20% is produced by the 66 other unknown companies.

(3) Link between mine and company is unconfirmed and production in 2018 is unidentified.

(4) Production in 2018 is unidentified

6. Locations of Sb mines and SoRs 2018 in South-East Asia

Figure C5. Locations of Sb mines and SoRs 2018 in South-East Asia. Most of the mines in China had refineries in the same location, or only one of the locations was identified and they are owned by the same company. The complete map and more details on the mines and SoRs (e.g. name, production) can be found via <https://www.google.com/maps/d/u/0/edit?mid=1Vjw7eNEx0twrsh0hFOxHrBg-nS3nzbNS&usp=sharing>

7. Antimony smelters or refineries (SoRs) globally (2018)

Total				135000	241500		

Table C2: Sb smelters or refineries 2018. Estimated production and operators/parent companies with made-up abbreviations for figure S6.

(1): The production is based on the ratio of the capacity to the total estimated production of ~135 kt.

Based on the import of antimony ores and concentrates (see also trade flows), there are also processing facilities in India, South Korea, Thailand, Vietnam, Italy and Japan. Possible producers include Yamanaka Group (Yamanaka Group, 2021) in Japan, Youngsun Chemical Co. Ltd and Thai Uniper Industries (Youngsun and Essen Corporation, 2010) in Thailand. Hindustan Zinc -HZL in India (Indian Bureau of Mines, 2020) and Korea Zinc (Korea Zinc, 2018) in South Korea. The production in 2018 per company is unknown. In Italy and Vietnam, no smelters or refineries were identified. These countries are exporting jointly ~11 kt of antimony products and ~8 kt of oxides (based on 99.5% grade). *The production of Campine SA could originate from recycling. It is a company that recycles car batteries and produces antimony trioxide (Antimony, 2019).

8. Antimony supply chain links between companies

Figure C6. Antimony supply chain links between companies. The size of the company nodes is linked to their production, the size of the countries and mines is not linked to production (all minimum). M=Mine, S=SoR, MS= Mine/SoR, OPR=operator, PC=parent company. Of note is that the mine and SoR operator can be the same company, and if no other parent company was identified, the operator is included as parent company. The abbreviations and references for the links can be found in table C1 and C2.

9. Comparison of trade flows and antimony production (mined and refined)

We used UN Comtrade (2020) to analyse net imports/exports by country. The total net import globally of antimony “ores and concentrates” was ~112 kt in 2018. According to USGS (2004) both clean antimony sulfide concentrate, and Chinese antimony concentrate contain at a minimum 60% antimony. The total net import of “antimony oxides” globally was ~62 kt in 2018 (based on the average grade of 99.5%, USGS, 2004) and the total net import / export of “unwrought antimony and powders” was globally 42 kt in 2018 (with a grade of 99.5%,USGS, 2004).

There are 5 countries (Morocco, Peru, Virgin Islands, Mozambique, Zimbabwe) that had a net export of antimony ores and concentrates in 2018 but did not mine it in 2018 according to the statistics of the USGS. In 2016 and 2017 these countries did not import antimony ores and concentrates (except for Peru, who imported only a small amount), possibly the exports are from previous years. Two of these countries (Morocco and Peru) did mine antimony in the past but ceased production in 2009 and 2012. According to Roskill (2018), there were artisanal antimony ores exported from Morocco, Mozambique and Ecuador (there are flows between Ecuador and Peru). As Zimbabwe is close to Mozambique, the flows from these countries could be explained by artisanal mining.

In the identified countries with SoRs there is a total net export of 58 kt of Sb oxides and 29 kt of Sb unwrought/powders. This is much lower than the estimated production of the SoRs (148 kt), this difference can be explained by manufacturing of Sb products in the countries of the SoRs (China, France and the United States). The estimated Sb SoR production of Belgium is close to the net import of antimony products (unwrought) and to the net export of oxides (10483). The estimated Sb SoR production of Bolivia, China and France are relatively high compared to the imports and exports. In China and France, the low quantity of export could be explained by national manufacturing of Sb products. Based on the import of antimony ores and concentrates (see also trade flows), there are additional SoRs in India, Italy, Japan, South Korea, Thailand and Vietnam. These countries were exporting antimony oxides in 2018 as well.

7. Zinc trade flows 2019

Figure D7 Trade flows 2019 (CEPII, 2023), green: zinc ores and concentrates (HS 260800) and orange: zinc unwrought flows merged (HS 790111, HS 790112, HS 790120), only including flows >75,000 metric tonnes. The size of the flows is ranked by the quantity of the flows. (Gephi, 2024)

8. Comparison of zinc trade flows 2020 to 2019

Figure D8. Comparison of quantity (metric tonnes) of zinc ores and concentrates (HS Code 260800) exported in 2020 compared to 2019. Red flows represent a decrease in exports and green flows represent an increase export. Size of flows is linked to the differences in quantities. (CEPII, 2023), (Gephi, 2024)

9. Comparison of zinc trade flows 2020 to 2019

Fig. D9 Comparison of quantity (metric tonnes) of all (the sum of) unwrought zinc flows (HS codes 790111, 790112 and 790120) exported in 2021 compared to 2020. Red flows represent a decrease in exports and green flows represent an increase export. (CEPII, 2023) The size of the flows is ranked by differences in quantities. (Gephi, 2024)

10. Relation between resilience mechanisms and attributes

Attributes	Resilience Mechanism	Explanation	Connection to Price Feedback Loops
Resistance (absorptive capacity)	Price feedback Loops and diversity of supply	The ability to maintain supply function by having multiple sources of zinc, such as various mines and suppliers, reducing dependence on any single source.	B1 (Main Loop): High prices can lead to increased investment in new mines and sources, enhancing diversity. B2: High prices may influence diversification in by-product processing.
	Stockpiling	Maintaining reserves to buffer against disruptions and ensure a continuous supply.	B5: High prices lead to stockpiling as a resistance mechanism; however, excessive stockpiling may contribute to reinforcing loop R1.
Rapidity (restorative capacity)	Price Feedback Loops	Mechanisms that allow the system to quickly adjust by responding to price changes.	B1 (Main Loop): Incentivizes faster investment in production to meet increased demand. B3: Encourages quicker investments in recycling to address supply issues.
	Material Substitution (and Improved Material)	Developing alternative materials or improving existing ones to address supply shortages or reduce dependency on a single material.	B4: High prices spur research and development for substitutes or material improvements, allowing rapid adjustment to supply disruptions.
Flexibility (adaptive capacity)	Material Substitution (and Improved Material)	Ability to switch to alternative materials or improve properties to adapt to changing conditions.	B4: Investment in substitutes and improved materials as a flexible response to price increases.
	Diversity of Supply	Adapting to supply disturbances by utilizing various suppliers and sources.	B1 & B2: Diverse sources and investments in multiple suppliers enhance flexibility by mitigating the impact of price increases and supply disruptions.

Table D2. List of interview participants and type of organisation

12 Zinc production and prices 2015-2022

Year	Mine production (million tonnes) (BGS, 2024)	Zinc metal (slab) production (million tonnes) (BGS, 2024)	Nominal price per tonne (average annual price) (Federal Reserve Economic data, 2024).	Real price base year 2015 (calculated based on nominal price and rate of inflation)
2015	13.413387	13.851276	1932	1932
2016	12.532841	13.7818	2090	2063
2017	11.9254	13.602975	2891	2795
2018	12.227675	13.088955	2922	2759
2019	12.483251	13.646643	2550	2366
2020	11.530291	13.843431	2267	2078
2021	13.531145	13.987191	3003	2629
2022*	12.610036	13.354966	3485	2825

*2022 is added later in 2024 when BGS data on 2022 became available

Table D3. List of interview participants and type of organisation

13 Zinc production and prices 2015-2022

Smelter	Company	Country	Year*	Production (metric tonnes) p/a	Capacity (metric tonnes) p/a	Reference
Hobart (Risdon)	Nyrstar	Australia	2023		280000	Nystar (2023a)
Sunmetals	Sun Metals Corporation Pty Ltd	Australia	2020	230000		Sun Metals (2020)
Balen	Nyrstar	Belgium	2022		400000	S&P Global (2022)
Três Marias	Nexa Resources	Brazil	2023		192200	Nexa Resources (2023b)
Juiz de Fora	Nexa Resources	Brazil	2023		96900	Nexa Resources (2023c)
Plovdiv	KCM Group	Bulgaria	2020		200000	SeeNews (2020)
Trail operations	Teck	Canada	2023		295000	Teck (2023)
Cezinc	CEZinc (Glencore)	Canada	2022	260000		CEZinc (2023)
Zhuzhou	Zhuzhou Smelter Group Co Ltd	China	2014		555000	Shanghai Metals Market (2014)
Huludao	Huludao Zinc Industry Co.	China	2017		390000	Shanghai Metals Market (2017)
Hanzhong	Hanzhong Zinc Industry Co.	China	2008		350000	Youser (2018)
Henan Yuguang Zinc Industry	Henan Yuguang Gold & Lead Co.	China	2020		300000	S&P Global (2020)
Sihuan	Sihuan Zinc & Germanium Technology	China	2018		150000	Shanghai Metals Market (2018b)
Yunnan Jinding Zinc	Yunnan Jinding Zinc Corporation Ltd.	China	2020		100000	Shanghai Metals Market (2018b)
Hanyuan Junlei	Hanyuan Junlei Zinc Industry	China	2018		40000	Shanghai Metals Market (2018b)
Hanyuan Yuanfu	Yuanfu Zinc	China	2018		30000	Shanghai Metals Market (2018b)
Baiyin	Baiyin nonferrous group co. ltd zinc	China	2017	280300		Shanghai Metals

						Market (2018a)
Smelter	Company	Country	Year*	Producti on (metric tonnes) p/a	Capacity (metric tonnes) p/a	Reference
Yunnan Chihong	Yunnan Chihong Zinc and Germanium Co. Ltd.	China	2012	160000		Sulhuric Acid (2012)
Shaoguan	Zhongjin Lingnan Nonferrous Metals	China	2023	120000		Asian Metal (2023)
Kokkola	Boliden	Finland	2022	294000		Boliden (2023a)
Auby	Nyrstar	France	2022		172000	S&P Global (2022)
Nordenham	Glencore	Germany	2022	164700		Glencore (2023a)
Chanderiya	HLZ India (Hindustan zinc)	India	2023		558000	HZL India (2023a)
Dariba	HLZ India (Hindustan zinc)	India	2023		240000	HZL India (2023c)
Debari	HLZ India (Hindustan zinc)	India	2023		92000	HZL India (2023b)
Binanipuram	Edayar Zinc Limited	India	2023		38000	Binaniindust ries (2023)
Bafgh zinc smelting	Bafgh Zinc smelting Co.	Iran	2020		30000	Supplierss (2020)

Table D6. Monthly zinc prices and stocks (S&P Capital IQ, 2023).

16. Commodity trading companies that are involved in the zinc trade: zinc operations, warehouse and logistics capability

Company and main office (country)	Total revenue USD (2017)	Corp. status	Reg. in (country)	Zinc operations	Warehouses and logistics capability	References
Glencore, Switzerland	205.5 billion	Public	Jersey	Zinc operations (10): Kazzinc integrated producer (69,7% shares) in Kazakhstan, McArthur River Mine and Mount Isa Mines in Australia, Nordenham plant in Germany, Portovesme zinc smelting and refining in Italy, Asturiana de Zinc, smelter in Spain, Kidd operations, General Smelting and CEZinc smelter in Canada and Volcan mine in Peru.	Glencore Port Operations (Australia) and Project Terminal Port Chancay in Peru. "Access World Group", a global network of port and warehouse facilities was sold by Glencore in 2023.	Trafigura (2018), Glencore (2023), IISD (2019), Mining (2023)
Trafigura, Switzerland	136.4 billion	Private	Singapore	Nyrstar's operating business is wholly owned by Trafigura. Nyrstar owns two zinc mines in the United States: East Tennessee mines and Middle Tennessee mines. It owns four smelters in Europe: Auby (France), Balen/Pelt (Belgium), Budel (the Netherlands), Stolberg (Germany), two smelters in Australia: Hobart and Port Pirie and one in the United States: Clarksville	Owner of Trafigura Maritime Logistics. Trafigura operates 60 warehousing sites in 30 different countries worldwide, with more than 4,000,000m2 of owned and leased storage capacity. Trafigura owns Impala Terminals to manage metals and infrastructure assets. It has operations in South America, Africa and the United States. In Peru it has expended a warehousing and blending facility at Callao, into the country's largest sit for zinc concentrates.	Trafigura (2018), Nyrstar (2023), Trafigura (2022). Trafigura (2023)
Koch industries (subs. Koch Metals Trading Ltd)		Private		No ownership of zinc mines or smelters found	KBX is subs. of Koch Industries. KBX is comprised of four subsidiaries: KBX Logistics, KBX Rail, KBX Int. and KBX Technology Solutions. Koch logistics owns warehouses in the U.S.	IISD (2019:19), Koch Metals (2023), KBX (2023), Koch logistics (2023)
Mercuria, Switzerland	104 billion	Private	Switzerland	Only investments in mining operations (e.g. in Vast Resources, producing zinc concentrate in Romania)	Mercuria partly owns Henry Bath, a metals warehousing, storage and handling business.	Trafigura (2018), Energy Industry Review (2018)
Gunvor Group, Switzerland	63 billion	Private	Cyprus	No ownership of zinc mines or smelters found	Warehouse ownership unknown	Trafigura (2018)

Company	Total revenue USD (2017)	Corporate status	Registered in (country)	Zinc operations	Warehouses and logistics capability	References
Noble Group, Singapore	46 billion (2016)	Public	Bermuda	No ownership of zinc mines or smelters found	Warehouse ownership unknown	Trafigura (2018), IISD (2019:19)
Mitsubishi Corporation Mineral Resources Group, Singapore	75 billion, metal trading 10 billion	Public	Japan	No ownership of zinc mines or smelters found (only investments in copper mines)	The subsidiary company Gauss Inc. is a logistics and warehouse company.	IISD (2019:19), Mercuria (2014), MitsubishiCorp (2022)

Acknowledgements

Completing this PhD thesis has been a challenging and rewarding experience, and I am deeply grateful to everyone who contributed to making this journey possible. I faced quite some hurdles along the way and without your support, encouragement, and guidance, this achievement would not have been possible.

First and foremost, I wish to express my gratitude to my supervisor, Professor René Kleijn. From the very beginning of this journey, your unwavering support, optimism, and confidence in my abilities were a constant source of motivation. Your practical feedback and insightful suggestions kept me focused and on track, even when the path seemed uncertain, thank you for believing in me. I would also like to extend my sincere thanks to Professor Arnold Tukker for his invaluable ideas, critical reviews, and support throughout this process. Your extensive expertise and sharp eye for areas of improvement have been instrumental in shaping this thesis into its final form. A special thanks goes to Dr. Jaco Huisman, whose encouragement and vision helped me at the very start of this journey. Thank you for initiating the idea of pursuing a PhD, connecting me with the CML team at Leiden University, and for our productive collaboration on my first paper. I am also grateful to Dr. Benjamin Sprecher for your invaluable assistance and enthusiastic collaboration on three of my papers. Your meticulous feedback, both on the content and the writing, greatly enhanced the quality of my work and your passion for the topic has been inspirational. I would also like to acknowledge Nabeel Mancheri and Anton Löff for their pleasant cooperation and significant contributions to Chapters 4 and 5 of this thesis. To the colleagues in the CERA project and my fellow researchers at CML, thank you for creating a collaborative and intellectually stimulating environment.

Finally, I would like to thank my family and friends for their moral support and encouragement throughout the years. Particularly to my husband and to my mother, thank you for your unwavering support, patience, and understanding. And to my son, you have been my sunshine, and you remind me every day of what truly matters. This PhD journey has been a shared effort, and I am very grateful to everyone who played a part in it. Thank you all for helping me turn this aspiration into a reality.

curriculum vitae

Susan (van Eijk) van den Brink was born on April 17, 1989, in Arnhem, the Netherlands. She attended the Thomas A Kempis College, where she completed her secondary education. Susan went on to pursue a degree in *International Development Studies* at Wageningen University, during which she also completed a minor in *Criminology* at Utrecht University. On February 29, 2012, she earned a master's degree in *Criminology* from Utrecht University, specializing in '*green criminology*'.

In 2011, Susan interned at the environmental crime unit of INTERPOL in Lyon, France, where she gained experience in international environmental crime investigations. After finishing her master's, she returned to INTERPOL in 2013, where she worked until the end of 2015 as a project assistant. In this role, she focused on analysing the illegal trade of waste and pollution-related crimes. From 2016 to 2021, Susan worked as a research associate with the Sustainable Cycles (SCYCLE) research team, initially hosted by the United Nations University Institute for Environment and Human Security and later by the United Nations Institute for Training and Research.

In 2017, Susan began her PhD at the Institute of Environmental Sciences at Leiden University. Her doctoral research was part of the CERA project, which aimed to develop a unified certification for the sustainable sourcing of minerals in Europe, incorporating environmental, social, and financial dimensions. Her PhD research was supervised by Prof. Dr. René Kleijn and Prof. Dr. Arnold Tukker. Since completing her PhD thesis, Susan has worked as a postdoctoral researcher on the MaDiTraCe Project at the Institute of Environmental Sciences.
