My first astronomical work (2003).

Curriculum vitae

I was born on January 15, 1997 in Brno, Czech Republic, a city infamous for its comically-shaped astronomical clock. Neither of my parents are astronomers or scientists, but my mother frequently took my brother and me to various public astronomy events in Brno. One of my earliest memories is a visit to the local planetarium, where we watched a movie about Pluto and received a booklet about the (back then) 9 planets of the solar system.

In 2004, my family immigrated to the United States. I did most of my schooling there, but my parents sent my brother and me back to the Czech Republic every summer to live with my grandparents. Eager to explore our new home, my parents also took my brother and me on road trips across the US, during which we visited the Kennedy and Johnson NASA centers. These visits cemented my early fascination with space, but this was only one of my many childhood obsessions – besides an affinity for science (especially chemistry), I also loved writing, visual art, music (I played the clarinet), and theater. As I grew older, I found myself approaching, with increasing stress, a critical crossroads: should I pursue a career in science, or the arts? Encouraged by the support of my high school science teachers, excellent performances in chemistry classes, and an internal pull, I enrolled in a chemistry BS with a physics minor at a college near my family, Kennesaw State University, in fall 2015. Simultaneously, I worked for my family's wedding photography business as a photographer's assistant, photo editor, and wedding album designer. I resolved to maintain high class loads each semester so that I could graduate early and save on college fees. I also worked various jobs throughout, including supplemental chemistry instructor, grocery store cake decorator, and waitress at a French café.

In my second freshman semester, I was eager to start applying the concepts I was learning in my classes to hands-on research. I approached Prof. Dr. Heather Abbott-Lyon to ask to join her research group in *astrochemistry*, which sounded like a perfect topic for my interests. Heather immediately put me to work, getting me trained on the ultrahigh vacuum (UHV) equipment in her lab. KSU had no chemistry PhD students or postdocs, so undergrads like me (and occasional master's students) ran the show in the lab. While such conditions are not optimal for a lab's productivity and output, I believe they are optimal for young students to develop an early sense of independence and empowerment. The Abbott Lab was also a part of the Center for Chemical Evolution (CCE), a consortium of groups from multiple universities studying the chemical origins of life. Being a CCE member gave me the opportunity to go on research visits to other labs at Georgia Tech and University of South Florida, where I worked with PhD students and postdocs and got a taste of what graduate school was like.

I quickly fell in love with research, astrochemistry, and UHV science, and I decided early on that I wanted to continue such research in graduate school. One of the first people I met in the Abbott Lab was a master's student, Danna Qasim, who went on to pursue a PhD in the Laboratory for Astrophysics (LfA) in Leiden University. Danna stayed in touch with me after leaving KSU, and after hearing from her what the LfA was like, I decided to make it my goal to work there one day. However, I also wanted to apply for US citizenship once I became eligible in 2018, and the application required that I continuously lived in the US until I was naturalized. So I devised a plan: I would apply for citizenship at the end of my bachelor's, get a US master's degree while waiting for naturalization, and then apply for a PhD in Leiden. In the meantime, I worked hard to become the perfect LfA PhD candidate. I spent every semester doing research in the lab, worked as a paid research assistant every summer, received several research awards and stipends, and presented at conferences all over

the US, including the Origins of Life Gordon Research Conference in 2018 thanks to a kind invite from CCE collaborator Prof. Dr. Matthew Pasek. I graduated with my BS after 3 years and spent what would have been my final BS year employed as a technician in the Abbott lab.

I filed my application for US citizenship the day I became eligible in November 2018. Around this time, Danna introduced me to Dr. Christopher Bennett at the University of Central Florida, who was looking for graduate students for his new astrochemistry lab. Chris was supportive of my plan and encouraged me to apply to the UCF PhD program and then master out, which would give me a flexible graduation timeline and a better stipend that would allow me to study without needing outside income. So in fall 2019, I entered UCF as a PhD student in physics on the planetary sciences track. In Chris's lab, I worked on a variety of projects, including electron irradiation of cosmic ice analogs and designing a UHV chamber for simulating space weathering of carbonaceous asteroids. Under the latter project, I applied for the NASA FINESST grant, one of the few NASA opportunities available to non-US citizen graduate students, and was awarded it. I also fell in love with Chris's other PhD student, Brian Ferrari (now my husband). Brian was supportive of my dream to go to Leiden and expressed interest in mastering out with me, but I figured there was little chance of two LfA PhD positions being open simultaneously and thus tabled my dream in favor of us being together.

In November 2020, I was finally naturalized as a US citizen. Then, in the spring of 2021, we heard the Leiden LfA was hiring two new PhDs. Given the timing, it seemed like a sign, so Brian and I reached out to Prof. Dr. Harold Linnartz to apply. He told us the positions had just been filled, but that another PhD position had opened for a combined laboratory and observational project to be co-supervised with Prof. Dr. Ewine van Dishoeck, along with an additional PhD opening in the theoretical chemistry group. Ultimately, we were offered and accepted these positions. During my final summer at UCF, I traveled to the University of Lille in France to work with Dr. Claire Pirim on a project analyzing PAHs in carbonaceous chondrite meteorites with a state-of-the-art two-step laser mass spectrometry setup. This work resulted in my first first-author publication, submitted right after I received my master's.

In January 2022, three weeks after the JWST launch, I fulfilled my dream and arrived in the Leiden LfA to conduct a PhD using laboratory and JWST data to analyze the chemical composition of interstellar ices. The PhD was co-supervised by Harold, Ewine, and eventually Dr. Ko-Ju Chuang following Harold's untimely passing in December 2023. Over the past four years, I have worked on a variety of experimental and observational projects that culminated in 5 first-author publications, 2 of which had accompanying press releases, and 20 co-author publications. I conducted experiments on the IRASIS setup and modified it in my final year to include a UV lamp and a quartz crystal microbalance. I learned how to propose for and analyze JWST observations and was awarded 36 total hours as PI of two JWST programs in cycles 3 and 4. I was a member of multiple JWST observing teams including JOYS+, IPA, and HEFE, and worked closely with external collaborators, including Dr. John Tobin at NRAO and Dr. Adwin Boogert at the University of Hawai'i at Manoa, whom I visited on a 2-week research trip. I presented my work in conferences and seminars in the Netherlands, Denmark, Germany, Italy, Spain, and 5 US states. I was also a teaching assistant for the Astronomical Spectroscopy course for 3 semesters and supervised the lab research projects of 4 bachelor students and 3 high school students. Following my defense, I will return to the US to explore the chemical links between interstellar and planetary ices as a Caltech Center for Comparative Planetary Evolution (³CPE) Postdoctoral Fellow with Prof. Dr. Michael Brown.

Acknowledgments

The science in my PhD may have been conducted in physical vacuums, but it was not conducted in social ones. If I had to quantify all the support I have received throughout my life leading up to this milestone, it would be a *quadrillion* times higher than the $\sim 10^{-9}$ mbar vacuum of IRASIS – like the ~ 1000 bar pressures in the deepest parts of the ocean.

I was lucky to have dedicated PhD advisors and mentors that also allowed me to forge my own path. Ewine: your devotion to your students is unbelievable – you truly embody leadership through service. Thank you for believing in me, holding me to high standards, and always finding time to talk about science. Ko-Ju: even before you formally became my advisor, you were always willing to guide me, discuss my ideas, and hear my frustrations over tea in your office. It was a privilege to work in the lab with you. Harold: I will always remember your kind and gentle nature, paper cakes, and funny stories. You were gone too soon. Adwin: getting to collaborate with someone whose work I admire and respect so much has been exhilarating. Thank you for engaging with my work and graciously hosting me in Hawai'i. John: thank you for entrusting me with your data, inspiring and supporting the HDO ice projects, and enriching my work with your gas expertise. Marina: when I was thrown into deep ends at the beginning of my PhD, you were there to swim alongside me and make sure I didn't drown. You are not only a brilliant scientist and mentor but also a deeply good person.

I also worked with incredible colleagues. Nashanty: when we're together, it's like we're simultaneously the stars and audience of a two-woman comedy-drama show. With you, dire situations turn into opportunities for camaraderie, reflection, and memes – I wouldn't have survived this PhD without you. Julia: you are such an immensely caring and supportive friend in so many ways. Our hangouts with you and Fabio made life in the Netherlands feel whole. Yuan: you are this brilliant combination of authentic, hilarious, and introspective that makes conversations with you delightful, whether they are about science or life. Łukasz: you were my gateway into the world of observations and are the reason my JWST programs exist. You are an incredibly devoted scientist. Thank you for all the patient explanations and passionate science chats. Logan: thanks for being down to bro out about regular science *and* bro science. Sierra: you have been both a role model and a friend – it means a lot to have someone to whom I can look up *and* relate. Jerry and Nienke: thank you for taking excellent care of Tina whenever Brian and I needed to get out of this country for some sun. Anita, Carlos, Domenik, Franciele, Helgi, Jeroen, Jessalyn, Julian, Lars, Laura, Lina, Pavi, Pranjal, Tara: I will fondly remember our lab scavenging sessions, setup jury-rigging, borrel drinks, and the riveting *Shrek de Musical* performance. Thanh, Milan, Cecilie, Pippa, Roshini: the future of the LfA is so bright in your hands. Alice, Andrés, Andrew, Giulio, Margot, Marissa, Martijn, Milou, Lisa, Lucas, Nico, Pooneh, Teresa, Will, Xunchuan: I loved learning about astronomy and traveling the world together. Bryce, Charlotte C, Femke, Daan, Charlotte S, Eyze, Mees: it was a joy to be a part of your journeys into science; I learned so much from working with you. Martijn and Robin: thank you for your mechanical work and building the QCM with me! Huib and Bram: you wrangled the most important tools I used in my PhD (and faced the horrors of Windows OS for me). Alina, Nancy, Somayeh, Robin: thank you for taking such great care of the institute and always helping me with a smile.

Before Leiden, many exceptional people helped me grow into the person I am today. Claire: you are such an astute problem solver, dedicated mentor, and one of my favorite people with whom I've ever worked. I aspire to be a scientist like you. Chris: thank you

Acknowledgments

for supporting my professional dreams. I hope the next chapter of your life brings you the peace and happiness you deserve. Joe: the skills your astrodata class taught me served as the foundation for all of my subsequent scientific work. Kerri: likewise, your observational astronomy course laid the foundation for my JWST work. Riley: it has been a blast meeting up in various corners of the world and always picking up right where we left off. Allison, Eric, Kenny, Alle, Brynn, Ryan, Jenny: you made our years at UCF memorable and fun.

Heather: you took me in as a curious undergrad freshman and turned me into a scientist. This thesis is a direct result of all the time and care you poured into mentoring me and nurturing my spirit during some of the most difficult years of my life. Stef: in addition to being an immensely shrewd and dedicated scientist, you are such a caring person. I was lucky to have met you in the ALL. TJ: I am grateful that I learned most of my UHV lab skills from someone so resourceful and *whimsical*. Danna: you were my first scientific role model and have been so instrumental throughout my research career. Thank you for all the support over the years. The CCE (especially Christine, Matt, Martin, David, Bradley): thank you for making me feel like a valued part of a research team even as a derpy undergrad. Jen Wallace: thank you for believing in my potential in the most angsty and erratic era of my life.

Dominique: you have been the longest-standing constant in my life over the past 13 years. I will always be down to help you carry your bags full of rocks (but I will *never* play Zoo again). Carmona-Ferrari and Brazilian friends family: I am so grateful to have married into such a loving family that immediately treated me as one of their own. Dědo a babičko: kdekoliv jsem byla ve světě, vždy jste mě podporovali. Děkuji za všechna společná léta, buchty, haldy ponožek a povzbudivé hovory přes skype. Jan: you are the only person who understands the unique microculture of our childhood, and you never fail to make me laugh. I'm so glad I grew up with you as my brother. Mummy: you are the strongest, most courageous, and most loving person I know. I was able to do this PhD because you nurtured my interests and raised me to feel free to live my life authentically, in the way that made me happiest. What a privilege it is to have received such a gift. Brian: meeting you was the greatest luck of my life. You push me to pursue my dreams, challenge me when I need it, and make me laugh until I cry. Without you, I wouldn't have made it to Leiden like I dreamed – this thesis is a result of your *promessa*, something I will always cherish.
